PC pricing could spur shakeout

Bad news for smaller players as corporate users return to big vendors

BY CAROL HILDEBRAND
L.W. 1101

Third-tier clone makers can kiss the corporate customer goodbye, users and analysts said last week, citing fallout from the recent price blitzkrieg from Compaq Computer Corp. and competing vendors.

"Why would you pick a Most Blessed Happiness bot from Taiwan when you can get a Dell for the same price?" said Richard Shaffer, a principal at Technology Partners in New York. "You'd be foolish."

Now that the market leaders have slashed their prices to form a level playing field, corporate customers are being snared back into the first-tier fold by the promise of long-term vendor viability as well as proven service and support.

"We really faced a dilemma," said Jim Hinsel, vice president of investment systems at UBS Asset Management (NY), Inc. "We didn't have the gall to try to justify a price comparison that was 3:1, so we started switching [to

Borland gazes through Windows at IS

BY JAMES DALY
L.W. 1101

Borland International, Inc. will attempt to execute a tricky double play this summer as it tries to take on aggressive competitors in the Microsoft Corp. Windows market while maintaining the loyalty of an increasingly demanding user base.

None after Chief Executive Officer Phil-

ippe Kühn started the Scotts Valley, Calif.-based company in a Silicon Valley hideaway, Borland stands at perhaps the most important crossroads of its history. The company is seeking to reach beyond its beginnings as a supplier of microcomputer software into the big leagues of partnering with information systems managers.

But first, Borland must not only break a product development logjam but also take steps to

IBM caves in to Legent on SystemView pact

BY JOHANNA AMBROSIO
L.W. 1101

VIENNA, Va. — After a year of negotiations, Legent Corp. last week joined IBM's SystemView initiative after IBM capitulated by offering a less-costly arrange-

ment. Legent's involvement could entice other software vendors to sign up, resulting in more SystemView products, thus creating an impetus down the road for hesitant customers to implement IBM's systems management architecture.

SystemView, announced in September 1990, is IBM's broad vision of how to manage heterogeneous systems across the enterprise. It's different vendors' software products from one or several points of control.

Users reacted positively to the Legent/IBM arrangement, but many said they are in no hur-

ry to implement SystemView. "We prefer [Legent's] products to be SystemView-compatible. We're not doing anything with SystemView at the moment, but it's important that Legent is going in that direction," said Corry Seaman, chief information officer at HomeFed Bank in San Diego and a Legent customer.

Raymond Wiles, vice president of data center services at TransAmerica Insurance Group in Woodland Hills, Calif., said, "SystemView is... something that will come in by osmosis, and

Microsoft seeks to prove NT's viability

Operating system delivery schedule still unclear

BY CHRISTOPHER LINQUIST
L.W. 1101

SAN FRANCISCO — As Microsoft Corp. attempts to test the "Net There" label off Windows NT, Microsoft says it will not be able to determine an absolute ship date until September, which coincides with the brand-based end-user beta test scheduled for that time.

Microsoft seems to be hedging somewhat on the release schedule. Dwayne Walker, director of Windows NT and networking products, said Microsoft will not be able to determine an absolute ship date until September, which coincides with the brand-based end-user beta test scheduled for that time.

Doubt reigns

Some observers were even more skeptical. "To expect that NT will be debugged and meet user requirements from a commercial environment perspective in 1992 or 1993 is unrealistic," said Judith Hurwitz, president of Hurwitz Consulting Group in Newton, Mass. She pointed to previous operating system releases that arrived late, including DOS 5.0 and OS/2 2.0, and said she expects third-party developers and Microsoft to encounter more problems than they seem to have anticipated.

Hurwitz also said some early NT developers she has talked to have expressed doubts that NT would ship on schedule.

But not everyone agreed. Other developers, including Frame Technology Corp. and Arbor Software Corp., think the December ship date is feasible.

"Yes, it seems realistic," said Siva Kumar, vice president of the Desktop Products Division at San Jose, Calif.-based Frame

Borland exterminating dBase IV 1.5 bugs

BY MARK HALLPER
OF STAFF

SCOTT'S VALLEY, Calif. — The ghost of Ashton-Tate Corp. was haunting the laboratories last week at Borland International, Inc., where technicians were trying to figure out whether dBase IV 1.5 is riddled with major bugs.

A spate of reports alleging dBase problems have run through electronic bulletin boards and other channels recently, prompting Borland's concern.

The more serious complaints maintain that index files are being corrupted to the extent that users cannot locate records, that dBase is losing text from memo fields and that memo field text is occupying entire disks, producing system hang-ups.

Similar problems led to the demise of Ashton-Tate, the previous purveyor of dBase. Borland acquired Ashton-Tate and the rights to dBase last fall. It released its dBase update, Version 1.5, earlier this year, a move

that developers had hoped would exorcise dBase's ills once and for all.

Borland has already begun issuing new dBase disks to developers who, during the last month, have reported what are "minor problems," according to Borland dBase product manager Vince Mendillo.

What proof?

The most severe bug that Borland has had to correct, Mendillo said, has been the inability of some dBase programs to operate the run function in DOS 2.1. The run function allows dBase to execute external commands.

But Mendillo said Borland "has been unable to reproduce" the more serious problems reported by at least three developers.

One of those developers, Susan Perschke, president of Spectrum Trade Design in Aurora, Colo., has developed a dBase 1.5 records management program

for the state of Colorado. Perschke said corrupt index files have made it virtually impossible to locate records, and her memo field text, which should have occupied about 20K bytes of disk space, swelled to 65M bytes.

"I had no space left to manipulate the data,"

she took me 3½ weeks to clean it up," Perschke said, noting that in order to safely store the data, she had to remove other programs from her 486-based system and store segments of data on numerous floppy disks.

"When this happened, it was like someone loaded 1.0," Perschke observed, referring to an earlier Ashton-Tate version of dBase. "It was hauntingly familiar."

Borland asked Perschke to send it the application and code more than a week ago, but Mendillo said the company had not yet received it. Perschke said last week that she had just

received permission from the state to send the program and would do so shortly.

Mendillo said he is aware of three reports of "anomalies with memo fields" but that any data that is lost can be recovered using utility files.

Could have been worse

Another developer — not one of the three reports — is Mike Kretzer, a financial systems analyst at Lockheed Missiles & Space Co. in Palo Alto, Calif. He said he lost data from his dBase IV 1.5 memo field recently. Kretzer is getting ready to replace dBase 1.1 with dBase 1.5 on a 40-MHz, 386-based personal computer.

"I lost a couple of small records I had to rewrite," he said. "It wasn't a big deal," he added, "but if it was a larger production file, I would have been quite upset."

Mendillo said Borland has not received enough complaints to consider the memo field problem a consistent, recurring pattern. He claimed that the memo field

problems may not relate to dBase per se but could be attributable to hardware configuration or other factors.

Possible roots

Michael Minch, a developer at Subaru-Isuzu Automotive, Inc. in Lafayette, Ind., pointed out that the cause could lie in clashing disk caching schemes, in which dBase's internal disk cache program fights with a computer's preexisting disk caching program.

Another developer, Pat Adams, president of DB Unlimited, a consultancy in New York, said the problems could stem from power dips, which are common during the summer.

There was a consensus that Borland must act to resolve what at this point is an enigma.

"If data is being lost, that's critical," said Fletcher Johnson, who is involved with a Bay area dBase user group and is president of Birchwood Systems, Inc., a development house in San Jose, Calif. "Anything else is just an annoyance," he added.

"If Borland gets right on this, they'll be fine," Perschke said. "If they take an ostrich approach, they'll be in trouble."

IBM, Microsoft call truce in battle of code rights

IBM OS/2 still support Windows but not NT

BY CHRISTOPHER LINDQUIST
OF STAFF

NEW YORK — A declaration last week that IBM and Microsoft Corp. have resolved their long-simmering software royalty dispute may have temporarily ended the bickering between the two industry giants. And the resulting calm may help users clarify the distinctions between clar-

two companies' 32-bit operating systems.

Prior to the agreement, observers were left guessing as to exactly how far and for how long each firm's rights extended over the other's product. Particularly at issue was how long IBM would have access to Windows source code for use in OS/2, a major selling point of IBM's "integrating platform," OS/2 2.0.

Now, a date of September 1993 has been set for the end of source code rights, with IBM retaining the right to clone Windows application programming interfaces indefinitely.

For those to whom Windows support is vital, the issue had caused some consternation.

"I think it lifts the cloud that was over OS/2 and the little bit of OS/2," said Sheldon Laube, national director of information technology at Price Waterhouse. He indicated that one concern over OS/2 had been its continued ability to support Windows applications. Under the new arrangement, such support is guaranteed for at least several years.

Of passing interest only

But while some users were relieved by the news, others said they felt it would have little impact on them.

Dave Arthurs, manager of systems planning at Ketter & Co., said, "I didn't really see how it was going to have any impact on us."

The deal should end the increasingly messy spitting match that began between the two firms when Microsoft announced its intention to stay away from the OS/2 path.

"IBM and Microsoft 'agreed to disagree on desktop operating systems,'" according to Microsoft Executive Vice President Steve Ballmer, "but they realized they must work together in some areas."

Those areas include the ability of IBM hardware to run Microsoft software, including Windows New Technology (NT).

Perhaps more important is the ability of customers to have some confidence in making purchase decisions, a situation that could have become a nightmare of Microsoft and IBM had locked horns in a lengthy legal battle.

There are no losers

Microsoft also wins. The various royalty fees owed to it by IBM are now clear, and a \$10 million to \$20 million payment lets it avoid wading through IBM's sea of patents in court. In addition, IBM will have OEM rights to Windows NT and can sell it on IBM hardware. And Microsoft will still be able to incorporate OS/2 code into NT until September 1993, although it is unclear if this will have a major impact on user interest.

While OS/2 is being touted by IBM as an "integrating" platform for using a variety of operating systems simultaneously, Windows NT is positioned more as a transitional operating system for users looking for a high-powered, secure environment.

The agreement also ends all speculation that any future versions of OS/2 will use all or part of the NT kernel. IBM gave up all rights to use the NT source code except for porting NT to its hardware. "We're not paying for development of NT," said Lee Reiswig, assistant general manager of programming.

Indicated by the title of the deal was too tailored to Windows to be of use with OS/2. However, he noted, IBM's OEM agreement will still allow it to use NT's source code to determine functionality and performance.

NEC repairs faulty drives

BY MICHAEL FITZGERALD
OF STAFF

ROXBORO, Mass. — NEC Technologies, Inc. confirmed reports from several sources that it is having problems with the 80M-byte hard drive version of its UltraLite notebook products based on Intel Corp.'s 80386SL processor and has stopped shipping them. The problem appears isolated to NEC and some of the 80M-byte hard drives it has shipped.

The company said the problem was in the firmware of the Quantum Corp. drive that is customized to work with NEC's system management software. A NEC representative said the firm has solved the problem, is in insurance testing and will resume shipping the 80M-byte drives this month. Until then, those customers that do have problems will receive 120M-byte drives at no extra cost.

While it refused to say how many drives were failing, NEC claimed the rate was higher than the normal hard disk malfunction rate but did not elaborate.

Richard Nelson Jr., vice president of agency systems at National Life Insurance Co., one of NEC's largest customers for portables, said he personally had received three machines with the problem, although the company in general did not have that high a failure rate.

Burying the hatchet

The IBM/Microsoft agreement appears to put an end to the fray that followed Microsoft's break with OS/2 — and no longer the two out of court.

The following terms will be applied by the new pact: • Microsoft will supply IBM with source code for all Windows versions that run on top of DOS, including 32-bit versions, until September 1993. Similarly, IBM will give Microsoft the source code for OS/2, until that time.

• Each company will be allowed to use the other's source code in its own products at set royalty rates. A Microsoft spokesman indicated that the royalty rate for each copy of OS/2 2.0 is somewhere between \$15 and \$30.

• IBM will receive source code to Windows NT under an OEM agreement for porting the operating system to IBM hardware.

• Microsoft and IBM will exchange technology patent libraries, allowing both to license for both current patents and any others that occur within the next five years. Microsoft agreed to pay between \$10 million and \$20 million for access to IBM's patents, according to Steve Ballmer, Microsoft's executive vice president of worldwide sales and support.

CHRISTOPHER LINDQUIST

LOOK WHO'S COOPERATING ON A COOPERATIVE-SERVER DATABASE

The world's largest database company introduces a revolutionary new technology called a cooperative-server database. A cooperative-server database hides the complexity of computer networks by enabling applications to access data located on multiple computers just as if all the data were stored on a single computer. In this way, a cooperative-server database simplifies application building and improves decision-making by making access to information easier...much easier.

Bill Gates
Chairman and CEO
Microsoft Corporation

"Oracle's always been the leader in building database technology. One of the great things about Oracle's approach is that they're hiding the differences between all the machines out on the network running on various platforms."

"ORACLE7's breakthrough in hiding technological complexity is analogous to the ease-of-use breakthroughs accomplished by the introduction of the Mac in 1984."

John Sculley
Chairman and CEO
Apple Computer, Inc.

"The fundamental problem with early client-server database management systems is that applications cannot access data on more than one server without a lot of extra programming. This programmatic approach to accessing data on multiple servers is in stark contrast to the totally automatic approach provided by ORACLE7."

Larry Ellison
President and CEO
Oracle Corporation

"With HP systems and ORACLE7, our customers will have the desktop to high-end performance they need for a fraction of the cost of mainframe computing solutions."

John Young
President and CEO
Hewlett-Packard Company

"ORACLE7 is really solving the complexities of the distributed computing environment cost-effectively. Plus, it supplies the reliability and security that are required in a distributed computing environment. In fact, because ORACLE7 matches Sun's client-server model so well, we have chosen ORACLE7 as one of our key databases."

Scott G. McNealy
President, CEO and Chairman
Sun Microsystems, Inc.

For more on ORACLE7, just call 1-800-633-1071 Ext. 8184. Find out what these industry leaders are excited about!

ORACLE

Software that runs on all great computers.

NEWS SHORTS

French firm buys IBM's Cadam line

France-based Dassault Systems, an IBM partner in the computer-aided design, manufacturing and engineering (CAD/CAM/CAE) market, last week formed a new firm that has acquired IBM's entire line of Cadam software products. The new firm, Dassault Systems of America Corp., will pursue a single, unified architecture to support both Cadam products and its own, Catia line of CAD/CAM/CAE applications. More than 3,000 IBM mainframe shops use Cadam and Catia products.

EPA ditched remainder of CSC pact

The Environmental Protection Agency last week canceled the last two years of a five-year, \$341 million contract with Computer Sciences Corp. (CSC) as part of the agency's overhaul of its procurement practices. The EPA is probing allegations that CSC overbilled for its computer support services but said the contract termination stemmed from a desire to reduce reliance on a single company.

Oak Ridge Lab buys Intel Paragon

The Oak Ridge National Laboratory in Oak Ridge, Tenn., will buy Intel Corp.'s Paragon XP/S, a supercomputer that runs at 150 billion floating-point operations per second. The laboratory will also serve as a beta-test site for the next generation of hardware and software for Intel's supercomputer line. The two companies also signed a three-year Cooperative Research and Development Agreement under which they will support the U.S. Department of Energy's Technology Commercialization Initiative.

Apple software eases DOS access

Apple Computer, Inc. last week unveiled Macintosh PC Exchange, a \$75 software package that allows Macintosh users running System 7.0 and equipped with an Apple SuperDrive floppy disk drive to read, write and format IBM Personal Computer-compatible disks. Files on the PC-compatible disk appear on the Macintosh's screen as standard Macintosh documents and can be imported into Macintosh-based applications. The DOS-formatted disk can be used to transfer Macintosh files to a DOS computer.

Bill limiting RBOC options wins one

The House Judiciary Committee last week passed a bill that would effectively bar the regional Bell operating companies (RBOC) from offering information and long-distance services and from manufacturing equipment. The bill would codify the terms of the AT&T Consent Decree and wipe out a court decision last year that said RBOCs could offer information services.

Short takes

Former Mellon Bank NA information systems chief George DiNardo surfaced last week as the new president of Neagata, Conn.-based FBC, Inc., the wholly owned IS subsidiary of Orlando, Fla.-based Kirschman Corp. ... Corporate Software, Inc. has appointed former Microsoft Corp. Senior Vice President Scott D. Old to its board of directors. ... The Multitasker DOS Federation has rejected Microsoft's demand that it stop using MDOS as part of its name. The federation is attempting to register MDOS with the U.S. Patent and Trademark Office. ... Lotus Development Corp. joined two major open systems groups last week: Unix International, Inc. and the Open Software Foundation. ... A wireless system for AT&T's EasyLink customers will be developed by AT&T and wireless network provider RAM Mobile Data. The product is slated for delivery next year. ... Storage Technology Corp. and IBM have teamed up—despite their rivalry in the tape-library market—to go after a multibillion dollar NASA contract, the 15-year Earth Observing System. ... Digital Europe and Apple Computer Europe, Inc. have signed a license deal to market a series of each other's products, including Apple Macintoshes and Digital Equipment Corp. interconnection products as well as VAX and reduced instruction set computing-based servers.

Aetna to slash IS staff by 700

Cutbacks at insurer are expected to save a total of \$200 million by 1993

BY KIM S. NASH
CWSTAFF

HARTFORD, Conn. — Aetna Life & Casualty Co. might do well to tack on "with less" to the end of its advertising jingle, "A policy to do more."

The fourth-largest insurer in the U.S. last week began pink-slipping the first of 4,800 employees targeted for layoffs between now and 1993 — 700 of whom will be cut from Aetna's 4,900-member information systems department.

Aetna's internal newsletter served as official notification of the layoffs for some employees, although scuttlebutt had permeated the ranks for months [CW, Feb. 3].

The layoffs — expected to save a total of \$200 million by the end of 1993 — raised questions about the status of Consistent Office, a plan started in 1990 to get Aetna's arms around its set of disparate office automation tools and set standards for software and hardware.

Several executives in the Aetna Information Technology (AIT) Group refused to comment, including John Loewenberg, AIT's senior vice president who reported to company Chairman Ron Compton.

May be positive

Analysts were optimistic, though, that the layoffs were a good thing. "They know where to cut. Ron Compton did a similar show at Emery [Airframe Express] in the 1980s, turning that

company around," said Robert Roubert, assistant vice president at Moody's Investors Service, Inc. in New York.

However, Riegel and other observers noted that certain risks are linked to such a large reduction. Low morale at a firm already hit with layoffs totaling

Source: Computerworld Press Release (10 September 1992)

2,600 employees during the course of 1990 and 1991 might just sink altogether, agreed Greg Schmeigel, a consultant specializing in financial services at The Ernst & Young Center for Information Technology and Strategy in Boston.

Technology is a major part of Aetna Health Plans, the firm's group health insurance unit, which has grown during the past few years via the acquisition of several regional health maintenance organizations (HMOs). The new HMOs likely left Aetna with duplicate functions in IS, as well as in other departments, that it would be wise to strip, said Ellen Barzilai, an insurance analyst at Alex. Brown & Sons, Inc.

Aetna management seems to

have realized this. For example, after absorbing Partners National Health Plans in Irving, Texas, in 1990, Aetna trimmed its work force and consolidated both existing and acquired IS functions [CW, Sept. 30, 1991].

Aetna recently took over Freedom Health Care, Inc., a large HMO based in Wayne, Pa., and Bay Pacific Health Corp. in San Bruno, Calif., but spokesmen would not indicate if IS cuts would happen as a result of these additions.

Too close for comfort
Insiders, who declined to be identified, reported being under management's microscope since January, as executives evaluated who was doing well and who was expendable as a way to "eliminate redundancies" in the department overall.

Although competitors such as The Travelers Corp. and Cigna Corp. have already made drastic staff reductions during the past few years in an effort to cut costs, Aetna was not necessarily late to the party, Riegel said.

He cited the companywide 2,600-person purge announced last in 1990 that coincided with an IS revamp.

In the fall of 1990, the company reorganized AIT to "try to get control of a chaotic department," according to a former IS staff member who asked to remain anonymous.

"The most recent round [of layoffs] is getting more attention because it's so big," Riegel said.

Diamond deals self out of Black & Decker

BY NELL MARGOLIS
CWSTAFF

TOWSON, Md. — Sidney Diamond, who helped push Black & Decker Corp. to the forefront of information technology use as its top-ranked information systems executive, may have worked himself out of a job.

Diamond worked in his badge last week. Contacted at home, he described his move as the logical and inevitable outcome of the very strategies he has actively helped implement during the past several years: "Downsizing, outsourcing and decentralizing."

"It's a question of how I've worked myself out of my job," said Diamond, who was vice president of worldwide IS. "It was just a matter of when to say when."

No particular event precipi-

tated his departure, he said. A several-year plan under way at the tool manufacturing firm to roll corporate IS employees out into the business units is reaching its final stages, he noted.

With "the last big chunk" recently transferred to the firm's core Power Tools Group, once-central corporate IS is now a significantly reduced stronghold — half of its former size. Once 175 strong in 1988, staffing now stands at 87, according to a source close to the company who requested anonymity.

But signs of an anticipated executive departure were scant

supply at Black & Decker last week. Don Lee, who reported to Diamond as director of technical services and operations, confirmed that he will be taking on the additional title of acting manager of worldwide operations "on an interim basis."

Precisely what duties come with the job, or whether it will roll into a permanent position as senior-most IS executive, remain uncertain, he said. A company spokesman declined all comment on the changing of the guard.

But if IS reporting lines and structure are unresolved, Black & Decker's IS mission is clear: "We will still provide the right tools and resources to enable the business to move quickly," Lee said. "And we won't be overly concerned with whose resources we're using — corporate IS or the business."

Diamond "worked myself out of my job"

There are over
435 ways to manage
your time. But only
one way to manage
an entire network.

Your way.

For everyone saying they'll add an hour to your day, there's a software vendor saying they'll manage your network. But only Systems Center products really let you manage the network you've built—the way you want to.

Our approach is truly peer-based—IBM®, Tandem®, Digital®, AT&T, and Fujitsu®. You make use of the network management tools you already have. And, you control your network from the point that makes sense for you.

Our products automate the routine parts of network management, freeing your staff for more important tasks. They'll also find our approach easy to learn, because it's built upon a rule-based, 4th-generation language.

If Systems Center products sound like the edge you need, call 1-800-533-5128 to schedule a presentation, or for more information. As soon as you've got a free minute, that is.

Great expectations for OSF DME '94 delivery

BY ELISABETH HOWITT
CW STAFF

Network managers seemed largely unfazed by the news last week that commercial implementations of the Open Software Foundation's (OSF) Distributed Management Environment (DME) will not start appearing until early 1994. The consensus seemed to be that the wait will be worth it — if DME lives up to its promise to provide the first viable framework for integrated, enterprise-wide network and systems management.

Last week, the OSF announced that it expects to make the full suite of DME protocols available for commercial implementation by the end of next year.

Hewlett-Packard Co., IBM, Digital Equipment Corp., and Tivoli Systems, Inc., are among the vendors that have promised DME implementations after the protocols are ready. This is the first official announcement of a delivery schedule.

For decentralized companies such as DHL Worldwide Express, DME provides the opportunity for different user groups to "choose the best network management solution for them and then provide interoperability," said John McShane, a project manager at DHL Systems, Inc.

Citibank "feels that a lot of DME's functionality will be very useful in the area of heterogeneous systems management," said Harriet Schabes, a vice president at Citicorp Technology Office in New York.

The system could send out a command to shut down a multi-vendor printer installation, and DME's Management Request Broker would have on record exactly what protocols and com-

mands are needed to find and address those printers, even if four different brands were involved, an OSF spokesman said.

"If Cisco or Wellfleet provided a router object in the right form, we could port it" to a DME-compliant management system, and it is immediately manageable via DME-compliant applications, "without training, headaches or customization," said Don Golden, a member of the Network Management Forum's User Advisory Council and a program manager at Shell Oil

Co. in Houston.

"The thing to really watch is how fast third parties bring out [network management] applications to run on DME," said Mary Johnston, a principal at Northeast Consulting Resources, Inc., a Boston-based consulting firm. Users have complained that today's proprietary systems only support a limited number of network management applications, she added. DME, potentially, solves that problem by letting third parties port their products to any DME-compliant system.

Points of resolution

DME also has the potential of resolving, once and for all, the ongoing "religious wars" about what will be the dominant network management standard because it supports both Common Management Information Protocol and Simple Network Management Protocol as well as a remote procedure call-based messaging system, according to Golden.

Users did express some anxiety over whether the OSF would adhere to its current schedule for releasing DME — recalling that earlier OSF standards efforts were delayed.

"The current schedule is practical, but we wouldn't mind seeing it hurry up a bit," Schabes said. "We are concerned that there might be delays. We won't stand still in the meantime. There's a lot you can do to ensure compatibility" of pre-DME systems.

Boole & Babbage is negotiating to join the alliance, Thierry added.

Max Watson Jr., chairman of BMC Software, Inc. in Sugar Land, Texas, said he would consider getting aboard the SystemView bus if "we were to get similar terms to Legent." He said BMC has also decided to sign up thus far because of financial reasons.

"It was a simple business decision, we looked at benefit and cost. For us the alliance made zero sense because it was not worth it," Watson said.

Corrections

Because of a typographical error, the June 22 issue of *Computerworld* reported that Wang Laboratories, Inc. is charging between \$1,000 and \$1 million for operating system software licenses on Vax 50 computers. The correct price range is \$1,000 to \$100,000. Also, the federal district judge who ruled favorably on the pricing issue did not go to California and not Massachusetts.

Northrup King Co. was mispelled in the June 15 issue.

What makes DME tick?

Distributed Management Environment is a hodgepodge of technologies and standards that are delivered by six major vendors.

Management User Interface

Sources: Tivoli, HP.
Functions: Motif-based graphical user interface, the ability to call services and information as objects.

Advantages: No need to strain network managers to work with each new network management system or application.

Application and Management Services

Sources: MIT, HP, Banyan Systems, Inc., IBM, Tivoli.

Functions: Common set of support functions such as printing, licensing, software and event management, event notification, policy implementation and classification of managed elements.

Advantages: Application vendors do not have to

reinvent the wheel but can concentrate instead on value-added features.

Application Development Tools

Sources: Tivoli, Groupe Bull.
Functions: Common set of interfaces for network management applications.

Advantages: Network management applications can be ported to any DME-compliant network management system.

Management Protocols

Sources: HP, Tivoli.
Functions: Management applications and systems can exchange information and commands with one another and with managed elements.

Advantages: In addition to object-oriented remote procedure calls, DME systems can interact with non-DME systems that support either Simple Network Management Protocol or Common Management Information Protocol.

ELISABETH HOWITT

IBM caves in to Legent on SystemView

CONTINUED FROM PAGE 1

it will take a long time to evolve."

Until last week, IBM's SystemView partners — called the International Alliance — included Buchman Information Systems, Inc. in Burlington, Mass.; Candie Corp. in Los Angeles; Goal Systems International, Inc. in Columbus, Ohio; Platinum Technology, Inc. in Lombard, Ill.; and Information Retrieval Co. in Chicago.

To become a full alliance member, a software vendor has to pay an up-front fee and a royalty on every copy of the SystemView product sold either by IBM or the vendor's own sales force (see chart).

A partner is born

The agreement with Legent, however, creates a new classification: development partner. The terms call for Legent to participate in the design and specifications of SystemView, but IBM will not market or sell Legent software. Bill Watson, director of enterprise management for IBM networking systems, said this new category is available to other vendors as well.

Although none of the parties

involved would discuss finances, the development partner category was said by one observer to be at least half the cost of the full alliance category — a difference that could mean up to \$1 million.

John Burton, Legent's president and chief executive officer, had declined to join the alliance under the original terms, saying that even though Legent supported the concept of SystemView, the cost to become an alliance partner was too high.

In past interviews, Burton had characterized the marketing

piece as especially inappropriate for a company of Legent's size. "We are not in need of marketing support," he said.

Esseas worries

The relationship, Burton added, "alleviates users' concerns about our ability to implement SystemView in a timely fashion. We never wanted a vision that said IBM was in one camp and Legent was in another, even though we've supported SystemView all along."

About five Legent products

already comply with the first level of SystemView integration — a user interface — with some 20 more slated for compliance, Burton added.

Another impetus for Legent to join the SystemView team was its pending acquisition of Goal, already an alliance member. Still, exactly what Legent's SystemView agreement means to Goal is unclear, said Steve Sasser, president of Goal's Systems Software Division.

"We'll have to sit down with Legent and IBM and talk about what makes sense for everyone. I expect this to happen over the next month or two," he said.

No big thrill

Some industry watchers, including Jeff Schulman, an analyst at Gartner Group, Inc. in Stamford, Conn., said the Legent/IBM relationship will not have much of an impact.

"I don't think that others will jump on the bus because the track record is so bad," he said. "It will help Legent's marketing because they will now have the Good Housekeeping seal, so to speak."

Oliver Thierry, director of marketing and business development at Boole & Babbage, Inc. in Sunnyvale, Calif., said, "You'll see SystemView gain momen-

tum as more companies join; things are going to open up."

Boole & Babbage is negotiating to join the alliance, Thierry added.

Max Watson Jr., chairman of BMC Software, Inc. in Sugar Land, Texas, said he would consider getting aboard the SystemView bus if "we were to get similar terms to Legent." He said BMC has also decided to sign up thus far because of financial reasons.

"It was a simple business decision, we looked at benefit and cost. For us the alliance made zero sense because it was not worth it," Watson said.

Parallel course

IBM's SystemView allies are now grouped in two categories

■ **SystemView Development Partner:** Gives companies an early peek at future releases of IBM products. Entitles them to sit on a design council to help draft technical specifications for SystemView. Other benefits include joint press conferences and press releases.

■ **International Alliance Member:** All of the above plus an agreement for IBM to help sell the product. Price tag is an up-front fee plus between 10% and 15% of the product's total license revenue.

"AN
ARCHITECTURE
OF POSSIBILITIES
IS ROOTED IN
THE CONSTANT
OF CHANGE."

The architects of software confront the same challenge as the architects of steel and glass: the constant of change.

Changes in business. And changes in technology.

There is one software architecture designed to deal with the constant of change: Sybase.

Sybase gives you the flexibility to create applications that integrate data sources of every kind—databases, multimedia, real-time sources, even mainframe applications—into a high performance client/server computing environment. The flexibility to modify those applications quickly as your business and

computing environment changes. And the flexibility to run those applications on the hardware of your choice: PCs, workstations, minicomputers, mainframes.

This flexibility makes Sybase the most effective technology for building today's on-line enterprise. And gives you a unique ability to adapt to the needs of tomorrow.

Sybase. Client/server architecture for the on-line enterprise.

To find out more about our database, application development and connectivity products, and our multi-vendor consulting services, call 1-800-8-SYBASE.

The Lloyd's Building, London. Designed by Richard Rogers. A loose, changeable framework constructed with open panels which can easily be adapted, removed or reconfigured as business needs change.

SYBASE

CLIENT/SERVER ARCHITECTURE FOR THE ON-LINE ENTERPRISE

MCI throws hat into frame-relay ring

BY JOANIE M. WEXLER
CWJWJ

WASHINGTON, D.C. — Though bringing up the rear of the frame-relay rollout parade, MCI Communications Corp. last week announced the availability of service on what analysts called the most promising platform to date for migrating users to Asynchronous Transfer Mode (ATM) switching speeds.

Frame relay is a faster packet-switching scheme aimed at efficiently accommodating local-area network interconnection and other applications that generate

unpredictable chunks of network traffic.

While MCI has suffered some industry tongue-lashings during the past year for being the last interexchange carrier to introduce a service, "it has missed out more on the frame-relay hoopla" than on business opportunities, said Chris Finn, an associate at TeleChoice, Inc., a telecommunications consultancy in Montclair, N.J.

Users have taken longer than expected to educate themselves about the fledgling technology, he noted. Meanwhile, MCI has built a T3 (45M bit/sec.) backbone network based on a core of Siemens

Information Systems, Inc. ATM switches. A version of Wellfleet Communications, Inc. routers that function as feeder switches at the boundary of the network convert incoming frame-relay traffic into industry standard-size cells for transmission across the network via the Siemens backbones (CW, June 29).

A better choice

The equal-size ATM cells have been deemed more appropriate for multimedia applications, which contain delay-sensitive traffic such as voice and video. Eventually, a third inner tier of MCI's network

will emerge to collect data from the T3 backbone and transport it at gigabit-speeds. The MCI platform is similar in concept to that of StrataCom, Inc.'s IPX switches — the platform for several other frame-relay services. However, the IPX cells are nonstandard sizes and top out at T1 speeds.

The higher speed base is important because "right now, customers see ATM as 'the Holy Grail' of networking," Finn said. "Larger customers who aren't particularly mobile have to look five to seven years down the road" at what technologies they will be using.

The MCI infrastructure is integrated with MCI's automated order entry, service provisioning and billing systems — a benefit to MCI customers cited in a research note drafted early last month by Gartner Group, Inc., a Stamford, Conn.-based consultancy.

MCI is initially offering both fixed-rate and capped usage-sensitive pricing schemes on a contract basis for its frame-relay service.

Proof that Okidata's newest printer will get you through thick and thin.

Frankly, we don't expect people who buy our new Pacemark 3410 to print an aluminum die thickness of a beverage can.

But our demonstration tells you a lot about how rugged Okidata's new dot matrix printer is — and how well it'll handle your heavy-duty printing load.

Sharp, clear 8-part forms, for example, are no problem for a printhead that can handle metal sheets. And continuous

heavy back-room data processing chores are a natural for a machine as reliable, it's been rated at 8000 hours MTBF.

But the all-new Pacemark 3410 has more than muscle on its spec sheet: speeds up to 550 CPS, built-in but code fonts, and a full range of paper-handling options (top, bottom, and rear feed; labels, envelopes, heavy card

stock, etc.).

Plus one more impressive feature — the Okidata OK! Our pledge that Okidata printers will deliver performance and value that don't just meet your expectations, but surpass them.

So if you're looking for a reliable, heavy-duty printer for DP, multi-part forms, bar code or network printing, see your Okidata dealer. Or call 1-800-OKIDATA.

OKIDATA OK!

We don't just design it to work. We design it to work wonders.*

Kimberly-Clark IS exec to consult

BY NELL MARGOLIS
CWJWJ

CHICAGO — Two weeks after handing in his chief information officer badge at Dallas-based Kimberly-Clark Corp., John T. Kohler last week turned up as senior practice leader in commercial manufacturing at Technology Solutions Corp. (TSC), a systems integration firm.

"This isn't a new departure for me; it's more like coming back home," Kohler said. A decade ago, Kohler worked at Arthur Young, where he was hired onto the information systems front lines by client Kimberly-Clark. His move to TSC reunites Kohler not only with the consulting business but also with former Arthur Young colleague Albert D. Beedle Jr., who is TSC's chairman and co-chief executive officer.

"Being on the expense side of the [corporate IS] equation was beginning to wear," Kohler said. "It was time to return to the revenue side." He declined to expand on his reasons for leaving Kimberly-Clark (CW, June 29).

The first of Kohler's challenges, Beedle implied in a prepared statement last week, will be shaping the manufacturing practice. He will need to counterbalance blows to TSC's bottom line sustained in its recently closed 1992 fiscal year as a result of shortfalls in its aerospace and defense practices. Notwithstanding that hit, the firm posted a profit of \$12.1 million on revenue of \$71 million.

Bring GUIs to Your COBOL Applications

Save
\$500 in July

...And Keep Your Interface Options Open With Micro Focus Dialog System 2.1™

Dialog System makes it possible to prototype and customize graphical user interfaces without learning complicated Application Programming Interfaces (APIs). Programmers familiar with COBOL can be up and running quickly with Dialog System.

And which "industry standard" user interface will best suit the end users at your site? Will it be Microsoft® Windows™, OS/2® Presentation Manager™, OSF/Motif™? Or perhaps character-mode interfaces for DOS and UNIX®?

When you develop user interfaces with **Dialog System**, it doesn't matter, because a single user interface can be portable across all these environments.

Dialog System supports "point and click" development of graphical and character-based user interfaces. It isolates screen and keyboard logic

from COBOL applications, replacing hundreds of lines of screen definition code with a simple CALL statement. That means smaller, faster and more reusable COBOL programs.

Dialog System user interfaces can be prototyped, developed and updated without impacting the application logic. When a prototype interface is completed, it can be put directly into production without any additional development.

Bring the excitement of GUIs to your COBOL applications with Micro Focus COBOL and Dialog System.

Call today. Take advantage of the special price on Dialog System and save \$500. Call Micro Focus at 800-872-6265.

Plethora of portables on way

BY MICHAEL FITZGERALD
CW STAFF

Vendor research laboratories will heat up this summer with the final preparations for an onslaught of portable technology targeted for fall delivery. Expect dramatic advances in weight and performance, with new features and entire new classes of devices hitting the market.

Some industry executives said they think the slew of new products and product types may create reasons for people to use several computers at a time, while some analysts speculated that some of the products will not survive. Driving the upcoming effort to differentiate portable products is the need for higher margins.

"It's been bloody out there, and vendors are realizing that a vanilla, 'me-too' box doesn't let them make any money," said Dan News Jr., an analyst at Computer Intelligence, a market research firm in La Jolla, Calif.

Vendors are moving to add features to their products, changing a market that was filled with Intel Corp. 80386SX-based

notebooks that were essentially identical in features.

"Now, analysts point to devices such as the removable hard drives employed by vendors such as Epson America, Inc., the modular architectures touted by Advanced Logic Research, Inc., among others, and the variety of new product designs from companies ranging from Computer Corp. to Beaver Computer Corp.

In addition, notebooks have embraced non-Intel chips, too. Many companies, such as Wye Technologies, Inc., use chips from Cyrix Corp. and Advanced Micro Devices, Inc. in addition to Intel chips.

Standard features will continue to get larger, while new technologies such as flash random-access memory cards have already prompted some notebook vendors to banish floppy drives. And notebook makers will remain on crash diets to drive weight down as low as possible.

The shift away from me-too notebooks drew praise from users contacted last week.

"I think the notebook change

is positive," said Chad Pearce, network administrator at Miller Mason & Dickerson's Philadelphia office. Pearce said less-expensive color screens in particular would be welcomed by his company, as would notebooks that could provide power-consuming 486DX technology without a loss in battery life.

Still, a more radical shift in portables than just color may be coming, if recently announced products from Dell Computer Corp. and Gateway 2000 Ltd. serve as a preview. Dell recently brought out a 3½-pound, slim 80386SL-based notebook computer, while Gateway released its Handbook, a 2½-pound, 6-in.-by-10-in. personal computer.

While analysts expect the notebook market to continue to grow, in part because of products like Dell's, the Gateway product and those like it have a less certain future.

"[Dell's] product is great. It shows the Phoenix ROM-based 8086 CGA subnotebook in the head," said Andrew M. Seybold, editor of the Brookdale, Calif.-based newsletter "The Outlook on Professional Computing."

A vital transformation

Notebook computers are metamorphosing in a variety of ways.

Today's notebook

- 600K to 1200K byte hard drive
- 80386 chip
- Modem (optional)
- 32M bytes of RAM

Standard options

- Pen capability
- Cellular or RF modems

Tomorrow's portables

- 80386 to 80486 chips
- Flash/RAM drives (may not be required)
- Above 200K byte hard drive

- 8086 to 80386 chips
- Flashcard drives or 1.44-in. hard drives
- 32M to 64M bytes

- Handheld I/O
- Flashcard drives
- 600K bytes

CW Chart: Janet Gennaro

Still, Seybold said, the lack of a floppy drive on the Dell machine could hurt it in the market, where the companion PC concept pushed by Phoenix Technologies Ltd. may succeed.

Informal systems managers contacted said they liked this new class of PCs for personal use but did not see it making the corporate IS budget.

"In our organization, our lap-

top users are on Windows and OS/2, so these subnotebooks are kind of a technological step backwards," said Joseph King, assistant vice president of IS at Continental Insurance Co.

Many vendors who plan to enter the market for subnotebooks, or palmtops, said they will position them as consumer electronics devices and not PCs.

Campaign '92: High-tech politics

BY CAROL HILDEBRAND
AND THOMAS HOFFMAN
CW STAFF

For George Washington, the closest thing to technical innovation was a set of poorly fitting wooden dentures that nonetheless made his speech more clear. Today's politicians increasingly rely on a battery of computerized gadgets to keep their campaign humming.

So far this election season,

technology applications have ranged from touch-screen voting to massive database applications to various forms of electronic debating.

At next week's Democratic National Convention, for example, delegates will vote via a touch-screen-based electronic voting system. The convention used a more primitive version back in 1988, but Roger Schneider, director of technology for the convention, said the

system has been updated to the point where he has almost eliminated the need for training.

When the delegates gather in Madison Square Garden, they will find 60 touch-screen-equipped point-of-sale terminals from NCR Corp. The terminals are tied to a Unix-based NCR 3B series that runs all of the back-office functions.

The chairmen of the delegations can each send the number of yes and no votes for planks for

their parties by touching the screen about three times. However, the systems will not be used to cast the actual votes for the presidential and vice presidential candidates—this will be done using good old paper power.

Schneider said a user could operate the system without any training, although the convention is providing classes. "Our paradigm was to imitate an ATM," he said.

Schneider said the party made a real effort to greatly amplify the use of cutting-edge technology. The convention is

running Microsoft Corp.'s Windows 3.1 on top of LAN Manager or on top of Unix and is also using Lotus Development Corp.'s Notes groupware.

On the GOP side

The Republican National Convention, which will be held Aug. 17-20 at the Houston Astro-dome, will not use electronic voting systems, according to Joseph Fleming, the press secretary for the convention. But it is not abandoning computer support altogether. Fleming said the convention is using 27 different databases supplied by DataPerfect, WordPerfect Corp.'s database offering, to access information on the convention's housing options in Houston, on transportation alternatives and on each of the volunteers working at the convention.

The Republican National Convention is deploying 180 Hewlett-Packard Co. and Compaq Computer Corp. workstations to access database information running over three Novell, Inc. networks. WordPerfect's Office Electronic Mail systems run over the Novell networks. Information is printed out on HP LaserJet III printers.

"It's another way of communicating office-to-office in a high-speed and accurate manner," Fleming said of the convention's computer operations. Despite the information systems infrastructure, he said, the convention does not have any plans to conduct electronic town meetings like the Perot campaign,

Pricing could spur shakeout

CONTINUED FROM PAGE 1

clones). Fortunately, now we can return [to name brands] because vendors have come back down in price."

With pricing rebalancing to Compaq's new low-end families already logged in from Dell Computer Corp. The Acer Group, Hyundai Electronics America's Information Systems Division, NEC Technologies, Inc., Digital Equipment Corp. and more in the works, industry analysts said, a shakeout among third-tier vendors is inevitable during the next 18 months.

In particular, several analysts have pointed out that some larger companies do not have the cash on hand to sustain a lengthy price war. "Sash vendors as AST, Dell, Gateway and ALR are probably OK," said Michael

Murphy, editor of the "California Technology Stock Letter." But, he added, "beyond that, it gets tough."

Users probably will not notice the winning because most of it will be the small, garage-type organizations, predicted Bill Bluestein, an analyst at Forrester Research, Inc. in Cambridge, Mass.

For Wally Nehls, a personal computer coordinator at a Midwest banking software developer, the wars mean he can stick with Compaq. Pricing considerations had been driving him to consider the lower-priced clones.

"The biggest thing is to stay with a vendor I trust," Nehls said, adding that both the financial stability of a vendor and its reputation for quality are very

important to him.

Mathew Cain, an analyst at Meta Group, Inc. in Westport, Conn., said many of his Fortune 1,000 clients are renewing interest in Compaq as a result of the price cuts. "People who were bouncing Compaq out of their RFPs are now relooking," he said.

For customers, the current climate means that taking a look at smaller companies' long-term viability before making a purchase is a necessity.

"Compaq has decided to press these guys to the mat. If you're buying low-end clones, you better rethink that but fast," Bluestein said.

Jim Haral, director of office technology at Boston, Allen & Hamilton in Bethesda, Md., agreed: "That's why we're not doing business with some of the truly no-name products. We didn't feel that they were going

to be around in six months to fulfill their one-year warranty."

However, a protracted price war, while good for customers' pocketbooks, could have a wear-and-tear effect in the long term as vendors continue to suffer losses while trying to price-cut their way to bigger market share.

Ten Willmont, an analyst at Aberdeen Group in Boston, said he did not think manufacturing costs, overhead and margins were coming down as fast as vendors' product prices. In a slow growth hardware market, he doubted whether the reductions would increase unit volume enough. "For the supplier side, it's relatively suicidal," he said.

Nehls agreed: "I don't think a price war will necessarily be good for the industry—it's like the airline price wars," where airlines have been hemorrhaging cash and, in some cases, dropping out of the market.

REACH OUT AND ACCESS EVERYTHING

EDA/SQL FROM INFORMATION BUILDERS: The Industry Standard Client/Server Solution That Lets Any Tool Access Any Data, Non-Relational or Relational, From Any Desktop.

INACCESSIBLE DATA IS USELESS

You've spent a lot of years and a ton of money building up the databanks you need to call on regularly to help run your business.

But, can you access your data fast when you need it? Even worse, if it's on an incompatible platform, can you access it at all?

Chances are the answer is no.

HOW BIG BUSINESS LOOKS AFTER BUSINESS

Happily there's another answer to the problem. It's called Enterprise Data Access (EDA/SQL) from Information Builders. The people who specialize in distributed information systems.

EDA/SQL extends the reach of desktop solutions. It enables virtually any application or end user tool that supports SQL to transparently reach any data in non-relational database files from any workstation.

REACH OUT AND RETRIEVE

With so many SQL tools integrated with many of the proprietary databases, you need a standard method of access with the power and flexibility to extend their range across distributed, multivendor systems environments.

EDA/SQL lets you do it -- and with both relational and legacy data systems, so your investment in all of your existing data is future proof.

Nothing else delivers this universal, flexible, access

capability in the day to day management of all your company's data.

So when you need to reach data, regularly, quickly, and regardless of platform, there's only one company to call.

Information Builders, the distributed information systems specialist.

For more information on EDA/SQL and how it can solve all your data access problems or to attend a FREE Seminar...

Microsoft seeks to promote NT

CONTINUED FROM PAGE 1

Technology. He added that the incremental releases of NT that his firm had been receiving were improving in quality, though some features, such as a True-Type font manager, were still missing.

More than 4,000 independent software vendors, analysts, users and journalists will reportedly attend the conference, where Microsoft will try to convince them that the 32-bit Windows NT is indeed the platform for future development.

Toward that end, Microsoft's battery of ammunition will include NT demonstrations and technical discussions, a keynote by Chairman Bill Gates and demonstrations and announcements of third-party development products by more than 40 vendors. Some 25 NT development tools will also be available at the conference, according to Microsoft (see story this page).

Taking it slow

Delaying the product, if necessary, may be a wise move. Microsoft has had a chance to learn from both its Windows 3.0 product and IBM's OS/2 2.0 that rushing to meet a deadline can hurt a company as users clamor for the bug fixes, device drivers and applications necessary to make an operating system usable.

Such thinking is evident in the company's bid to get early versions of the NT developers' kits into as many hands as possible. Every attendee at the conference will be given a compact disc/read-only memory (CD-ROM)-based kit that contains pre-release versions for both In-

Microsoft will tout its 32-bit Windows NT as the platform for future development.

tel Corp. and Mips Computer Systems, Inc. platforms of Windows NT, Win32 Software Development Kit (SDK) tools and a 32-bit version of the Microsoft C++ compiler as well as all on-line documentation. After the conference, developers will be able to purchase the SDK for a list price of \$399 with paper documentation or \$69 as CD-ROM only. The low pricing should help get the kit into the hands of some 20,000 to 30,000 developers that Microsoft hopes to have using NT by this fall.

Such a strategy will no doubt work in Microsoft's favor as it will help make available a large number of 32-bit applications the moment NT ships, which could help sway customers.

"We're anxious for our vendors to explore NT," said Dave Arthur, manager of systems planning at Kotter & Co. in Chicago. Arthur said his company is concerned with IBM's ability

to sustain OS/2 2.0 and added that Unix was very appealing.

However, he said, if NT meets its hype, it could give him the best of both worlds: the functionality of Unix and the familiar interface and wide variety of applications for Windows.

"What makes me feel comfortable with NT is hearing that developers are going to get copies," he said. "That's the only way that [Microsoft's] really going to be able to fine-tune the operating system."

Borland compiler elicits cease-fire with Microsoft

Industry archrivals to cooperate at conference

BY MARK HALPER
CIVILIAN

SCOTT'S VALLEY, Calif. — In recent weeks, Borland International, Inc. Chairman Philippe Kahn has let loose with a series of unflattering remarks about Microsoft Corp., likening Microsoft's Fox logo to a dog and claiming he has tried Windows but has not installed.

But at least for a moment at this week's Win32 Professional Developers Conference (see story page 1), the two companies will swap olive branches.

Not that either company has been overwhelmed with reverence toward an archrival. Rather, both are approaching an hour of need.

The occasion will be a 60-minute presentation by Borland of its C++-based object-oriented compiler — a product that will go head-to-head with Microsoft's own C++ — for Microsoft's Windows New Technology (NT) and for the Win32s application programming interface.

The demonstration will mark

Borland's first public showing of its NT C++ compiler, and it will apparently also mark the first time that Borland has chosen to demonstrate a product at a Microsoft event. "We're taking it up several levels," said Gene Wang, vice president and general manager of Borland's Languages Business Unit. "We've never been part of one of their conferences."

Hoping for exposure

The timing is understandable, considering that Microsoft, Digital Equipment Corp. and Symantec Corp. all plan to start offering their own C++ compilers next week. Borland will not ship its product until after NT becomes available and hopes its demonstration next week will mind share among other developers.

For Microsoft, having the leading C++ on hand at the NT developer's conference should help build NT momentum.

There is one addendum to the scenario. Borland has not completely let down its barbarian. Kahn himself will not be there.

Developer show touts Windows tools

Attendees to see dozens of demos — with many more products promised.

BY CHRISTOPHER LINDQUIST
CIVILIAN

SAN FRANCISCO — Tools, tools, tools.

In addition to supplying all of its own development products, Microsoft Corp. claimed that some 100 independent software vendors have promised to release more than 141 tools for 32-bit Windows, including Windows New Technology (NT). To help get the word out, Microsoft will ship a compact disc/read-only memory package containing a variety of test, advertisements and working models of 32-bit third-party tools to all Win32 Professional Developers Conference attendees two or three weeks after the conference.

Thirty-six companies reportedly will be demonstrating products at the conference, and about 25 of them should be ready to take orders, at least for beta-test versions of their products. Still other vendors will be announcing tools at later dates. Among the committed vendors are the following:

- Texas Instruments, Inc. has pledged to make its Information Engineering Facility computer-aided software engineering tools available on NT.
- Sybase, Inc. will be on hand

to show off a 32-bit, multiprocessor version of SQL Server for NT running on a four-processor machine.

Not to be outdone, Oracle Corp. will have its Oracle Server up and running on an NT-based system. Oracle was seen running on a multiprocessor NT

KPWIN for NT.

- Digital Equipment Corp.'s DEC C++ for Windows NT.

- Black Sky Software Corp.'s WindowsMaker, BugMan and RoboHelp Windows design and debugging utilities.

- Congruent Corp. will demonstrate the GNU programming tools popular on Unix platforms, for NT.

- Accucore-85 plans to supply an NT version of its product that already runs on i386 and mainframe environments.

- Easel Corp. will unveil its EaselWin for T application generation tool.

- Frame Technology Corp. will be on hand to demonstrate FrameMaker for NT, the 32-bit Windows version of its popular Unix publishing package.

- Computer Innovations, Inc. will have a pair of tools on hand: DEBUG 2000 and EDIT 2000.

- Caseworks, Inc.'s WorkBench will be on the show floor for demonstrations.

- Guild Products, Inc. will unveil the Guild Prototyping for 32-bit Windows.

- Moser Systems Corp. will have an NT version of its product available for demos.

- XDB Systems will show XDB-Server for Windows NT.

Newer Technology

While the pre-release version of Windows NT will be aimed primarily at developers of 32-bit Windows applications, the final version — scheduled for release at year's end — should contain much more, including the following:

Available at release:

- Complete DOS, 16-bit Windows, Windows NT, Poix and OS/2 character mode subsystems.
- Transmission Control Protocol/Internet Protocol and a Distributed Computing Environment Remote Procedure Call-compliant support.
- Built-in Microsoft Mail support.
- Ability to use NT as both a client and a server in networked environments as well as redirectors for use with LAN Manager, Novell, Inc.'s NetWare and IBM's LAN Server systems.
- Full multiprocessor support.

Available simultaneously with or shortly after release:

- NT-specific SQL Server with 32-bit and multiprocessor support.
- Systems Network Architecture services and a variety of system and network management products.

CHRISTOPHER LINDQUIST

Novell NMS rollout puzzles industry

Incompatibilities between Windows and OS/2 versions discovered

BY ELISABETH HORWITT
AUSTIN

PROVO, Utah — One point that Novell, Inc. did not make clear at the debut last February of its NetWare Management System (NMS) is that it was announcing not one, but two products, which can barely speak to each other.

Despite the OS/2 version's strong backing from the Novell/IBM alliance, the Microsoft Corp. Windows version appears to be the winner in terms of functionality and user and developer support. "I guess the market is pulling" toward Windows at the moment, Novell spokesman Duane Murray said. Novell recently sent out 600 copies of NMS in a controlled release.

Novell said it will soon provide more interoperability between the Windows version and the IBM OS/2 Presentation Manager version of NMS. However, the current versions might as well be from two different vendors: The products cannot exchange alerts or other management information, they target different types of network installations, and their user interfaces differ.

"It makes a big difference to a network administrator having to look at two different environments," said Craig Burton, chief executive officer of The Burton Group, a Salt Lake City consulting company.

Different goals

Furthermore, the two versions target very different markets. The OS/2 version targets shops where IBM host networks and Novell local-area networks predominate, while the Windows version represents Novell's bid for the enterprise internet-worked LAN market. The Windows version supports Simple Network Management Protocol as a way to manage a wide range of network products; the OS/2 version does not.

Murray indicated that Novell and IBM are working to integrate OS/2-based NMS with Distributed Systems Management, the OS/2 implementation of IBM's SystemView that IBM has promised to release later this year.

Right now, however, the only advantage that OS/2-based NMS offers over the Windows version is its ability to let users "walk through the NetWare Management Information Base one line at a time" — a capability

that few users really need, Murray said.

Novell also confirmed that the two NMSs have incompatible application programming interfaces. This means that third-party vendors committed to

supporting NMS on their products will either have to go with just one version or make the integration effort twice.

Of the several dozen vendors that have made that commitment, the "vast majority" have opted to support the Windows version, Murray said.

NMS will remain "pretty basic" until third-party products start bolstering its functionality,

Burton said. Novell confirmed that third-party support is crucial to its NMS strategy.

Attesting to the marketing confusion surrounding the two unannounced versions, Jim Queen, LAN manager at Enron Gas Services Corp. in Houston, said he is using the Windows-based NMS "because I didn't know there was an OS/2 version."

No LAN Is An Island

Local Area Networks Are Islands Of Productivity. But When It Comes To Interoperability, No LAN Is An Island.

Out with the Old Way. In with the Gateway.

To enable your LAN users to communicate with the rest of the world, you can give them each a modem. That's the old way. And then there's the "Gateway". Gateways let your LAN users share modems. And the MultiCom Async Gateway allows more users to share fewer (and faster) modems.

More Users, Fewer Modems. Higher Speed, Greater Efficiency.

The MultiCom Async Gateway incorporates high speed V.32 and V.32bis Multi-Tech modems and 57.6K bps serial ports, so your users tie up modems for shorter periods. Unlike some gateways that require dedicated dial-in or dial-out modems, the MultiCom Async Gateway lets your users dial in or out at will.

Make All of Your Users "Power Users"

The number to call: (800) 328-9717. Because no LAN is an island. And there's no better way to accomplish LAN-to-WAN connectivity than with Multi-Tech.

HP debuts high-speed net chip

Hewlett-Packard Co. has unveiled what it said to be the first silicon chip set to support high-speed, point-to-point communication rates of up to 1.5 Gbit/sec. The HDMIP-100 Gigabit-Link Chipset is ideal for network boards that support broadband standards such as High Performance Parallel Interface (Hippi) and Asynchronous Transfer Mode, as well as multimedia, HP said. The chip set's compact design enables it to be incorporated into boards that will cost up to 80% less than current offerings, according to HP. Broadband Communications Products, Inc. said it is planning to release a serial Hippi board, priced under \$20,000 and based on the chip set, in the fourth quarter.

IBM, AS/400 VAR spar in court

IBM Credit Corp. testified last week that Legal Eagles Software Systems, Inc., a San Diego-based developer, owes IBM several hundred thousand dollars for Application System/400-related deals made in the late 1980s. Legal Eagles counter-claimed, saying it had overpaid its bills, and pointed to a deposition by a former IBM employee who confirmed the claim. A decision could come as early as Wednesday, said Paul Breen, Legal Eagles' attorney. IBM Credit's lawyer was unavailable for comment.

AST shuffles deck, COO resigns

AST Research, Inc. Co-chairman and Chief Operating Officer Thomas C. K. Yuen resigned last week at the behest of AST's board as part of wide-ranging management overhaul. The directors, acting on the recommendation of a management consulting firm, decided both to replace AST's two-person chairman with an outsider and to phase out the COO post, a spokeswoman said. Former AST Co-chairman Safi Qureshy remains with the company as chief executive officer and president. Carmelo Santoro will assume the position of chairman of the board, while Yuen will remain on the board.

Unsys beefs up Unix server line

Unsys Corp. expanded its line of Unix-based U 6000 mid-range servers with the debut of the U 6000 Model 65 servers. They incorporate Intel Corp.'s i486 CPU with a complex instruction set computing-based architecture that was designed for symmetrical multiprocessing. The new models deliver between 42 million and 200 million instructions per second. A single processor system with 16M bytes of main memory costs \$24,000; a dual-processor system with 64M bytes of main memory and 425M bytes of disk storage costs \$47,500.

IBM ends CFC use at San Jose site

IBM turned off the last chlorofluorocarbon (CFC) cleaner at its San Jose, Calif., disk drive manufacturing facility last week—a site once regarded as one of the worst producers of ozone-depleting CFCs in this country. Five years ago, it reportedly released 1.5 million pounds of CFCs, more than any other plant in the nation. The shutdown came 18 months ahead of schedule, IBM officials said. The San Jose facility will now perform water-based cleaning and high-temperature drying for disk drive parts. According to IBM, it has established a goal of eliminating all CFC emissions in all manufacturing operations by the end of next year.

Shenit takes

Short Data Systems said it dropped out of the Advanced Computing Environment consortium mostly because Intel's next-generation chips are progressing much more rapidly than expected. . . . Cyrix Corp. cut retail prices on its FastMath math coprocessors by 60%. The new prices range from \$79 to \$129. . . . Microsoft Corp. and Oracle Corp. will join forces to ensure links between their products and will co-develop a driver to the Oracle database. Oracle will also contribute to the Microsoft Open Database Connectivity Specification. . . . ICL will resell 3Com Corp.'s networking, wiring hub and terminal servers.

Imaging a role model for IBM

Unit's focus on software and services reflects Big Blue's corporate goals

BY ELLIS BOOKER
CINCEATI

CHICAGO — IBM's document imaging business, among its newest product lines, has unexpectedly evolved as a test bed for new corporate concepts at the company, according to analysts.

"Image is almost a guinea pig in the transformation of IBM," said Scott McCready, a principal at IDC/Avante Technology in Framingham, Mass.

That transformation involves an emphasis on software over hardware and on generalized business consulting and systems integration services. It also includes what even IBM officials acknowledged is an "opportunistic" approach to the technology and the fast-paced market it spawned.

"We were trying to get into a market where we were not . . . and we were trying to get there fast," said S. Craig Grant, manager of cross-platform marketing and management at the IBM Image Solutions Group.

Imaging "fits nicely with a software and services orientation," said Maureo Early, IBM's U.S. manager of image consulting services. According to Early, the Image Solutions Group is geared to offer full life-cycle consulting, from re-engineering business to implementing systems. She pointedly noted that in its consulting capacity, the company would recommend both "IBM and non-IBM components."

Taken together, the market-driven stance of the IBM imaging group may mean dicey choices for users. For instance, IBM to date has steadfastly supported the use of OS/2 workstations for ImagePlus. In this way it toes the corporate party line in support of OS/2. Yet the undeniable popularity of Microsoft

Corp.'s Windows environment and its prevalence among other imaging products appears to be forcing a change.

Significantly, IBM showed a prototype of a Windows 3.1 client for ImagePlus/2 at its booth at last month's annual Association for Information and Image Management (AIIM) show in Anaheim, Calif.

Under pressure from a handful of top customers several years ago, IBM entered the im-

age world top \$1 billion this year.

Morin said the mainframe and midrange ImagePlus products are each \$300 million to \$500 million businesses. He added that he saw the same potential in Unix, local-area network—and client/server-based products — those sold directly by IBM and by its business partners.

In total, IBM claims 700 ImagePlus installations, representing approximately 450 of the Ap-

Seeing a new image

An IBM survey of user companies at the AIIM show found imaging a critical factor in achieving a competitive advantage

Base: 377 senior managers surveyed on June 23 from financial, data processing, manufacturing, utilities and government organizations

Source: IBM

aging market. But it did so in what appeared to be a haphazard and somewhat uncommitted way.

Mark Morin, vice president of the Image Solutions Group, said that when he was appointed in 1986, "I had no one working for me." Morin's organization now has a staff of 550 workers. If IBM's imaging group still seems to be feeling its way in the marketplace, the business is doing nicely.

At a press briefing at AIIM, Morin said revenue from IBM's ImagePlus line was \$605 million last year.

That result reflects sales of its mainframe and midrange products, he said, predicting rev-

enue from ImagePlus/400 products and 250 of the mainframe products. IBM also claims to have sold "dozens" of its Personal System/2 LAN products, which became commercially available at the start of the year.

Still, the need for an integrated product suite is a looming issue. "Customers who wanted to deploy more than one imaging platform have been, up to now, a hypothetical issue," Grant said. He added that because ImagePlus does have some core "concepts," including object orientation, communications (LU6 and Token Ring) and support for Systems Managed Storage, its pieces will work together as customers demand.

Prime to split ownership of 50 Series line

BY KIM S. NASH
NEW YORK

NATICK, Mass. — Prime Computer, Inc. plans to hand over responsibility for its 50 Series hardware business — an interest-free loan of up to \$20 million — to COPM, Inc., a new company headed by Neil McMillan, president of Prime's Computer Systems Business Unit, according to documents filed with the Securities and Ex-

change Commission (SEC).

The papers, filed late last month with an initial public offering for stock in Prime's ComputerVision software unit, include the following provisions:

- COPM would be given sole rights to database/application development systems Prime Information and PI/Open, which is estimated to be worth \$25 million.
- COPM and Prime would share ownership of the 50 Series, including two- and four-way multiprocessing products currently in development, known as the Toons project.
- Prime would retain exclusive rights to service 50 Series users — both the installed base of approximately 8,700 systems and any new, business COPM might

generate.

If the deal goes through, Prime users such as Whitehall Co. in Needham, Mass., would have to deal with two separate vendors: COPM for hardware and systems software and Prime for service.

The proposed agreement, subject to board and SEC approval, makes George Bailey, MIS director at Whitehall, a bit uneasy. One reason users have contracted for service directly with Prime rather than going to a third-party provider has been the company's "inside and out" knowledge of the proprietary hardware and software, Bailey said.

"I wonder whether that link will be as strong if they're two separate companies," he said.

Informix Database Technology Helps The Home Depot Assure That "Low Prices Are Just The Beginning."

When The Home Depot decided to make a long-term commitment to UNIX® and open systems, they turned to us, Informix, the experts in UNIX relational database management systems.

A Flexible, Economical Computing Environment.

Home Depot, America's largest home center retailer, wanted hardware independence, shorter development life cycles, and better system performance—all at reduced costs. Home Depot made a strategic decision to convert its "do-it-yourself" stores to UNIX-based platforms and applications.

The Home Depot chose Informix's database as part of their UNIX solution. Reduced Deployment Times and Increased Productivity.

The Home Depot uses the INFORMIX-4GL Product Family to develop applications including inventory, labor management, and other customer service-driven applications. Home Depot expects the applications will be used by up to 4,000 system users. That number should grow in line with the company's projected new store opening rate of 25 percent per year.

The Home Depot and thousands of other companies have called on us for 12 years to successfully handle their critical data.

If you're considering UNIX for data management, talk to Informix. Because we're the experts.

Call 1-800-888-IFMX.

...better.

If you think the new HP Corporate Business System can't handle mainframe applications, think again.

This isn't simply a new, extremely powerful piece of hardware. It's a new tool for improving the way you do business.

Because now you can run those big mainframe class applications far more economically than ever before. In a more open environment. With dramatic cuts in the cost of maintenance and infrastructure. And with the speed and efficiency that business demands.

Who's supplying the solutions? How about Andersen Consulting; CGI Group; CINCOM; Computer Associates; Dun & Bradstreet Software; Information Builders, Inc.; Oracle Corporation; SAP; SAS Institute; Software AG; and Texas Instruments. To name a few.

With prices from \$335K to \$1M (as much as eleven times less than the cost of mainframes), our systems make it much easier to manage large data centers. And your budget. Especially since they're designed to work in multivendor environments.

Hewlett-Packard also announces HP Premier Account Support. This

includes systems planning and operations consulting, as well as the services and rigorous support requirements needed to maximize the uptime of your data center.

Call 1-800-637-7740, Ext. 3283 for details. And get more power for your money than you ever thought possible.

Think again.

HP ready to fire next volley in RDBMS battle

BY JEAN S. BOZMAN
and MARK HALPER
CW 10/97

PALO ALTO, Calif. — An aggressive Hewlett-Packard Co. today hopes to answer the challenge posed by Oracle Corp. and other relational database management system vendors when it introduces a steeply discounted, faster upgrade to its AllBase/SQL relational database.

HP's revamp of its 4-year-old product includes many distributed database features that are comparable with those introduced last month in Oracle's Version 7 — and it competes with the latest wave of

products from the major independent RDBMS vendors.

New features will include stored procedures, triggers, two-phase commit for on-line updating and row-level locking for data integrity. HP has included several unique features, such as database shadowing for on-line backup, which posts all recent changes in the database to a second copy of AllBase/SQL.

To promote sales, HP is steeply discounting AllBase in comparison with similar products. Prices range from \$1,500 to \$30,000, depending on system configuration. The database is currently available for HP's proprietary HP 3000 family, and

it is slated to ship next month for HP's Unix-based reduced instruction set computing-based workstation and minicomputer lines.

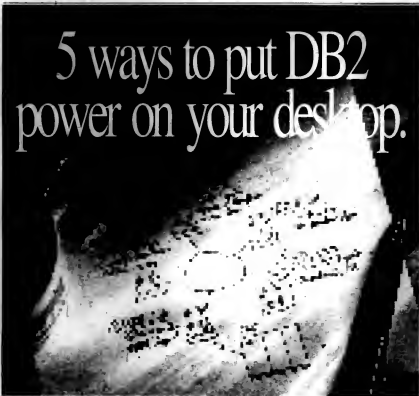

But while HP hopes to lure database customers through aggressive pricing, its ultimate goal with AllBase is to promote sales of HP minicomputers — both the proprietary 3000 line and the 9000 Unix series — and its Unix workstations, according to John Robertson, research and development section manager at HP.

Therefore, HP will continue to walk a fine line between promoting its own database and encouraging leading database vendors such as Oracle to write for HP

platforms, Robertson said. AllBase/SQL has been tuned to provide 30% to 50% better performance than any independent RDBMS running on an HP MPE/IX or HP/UX machine, he added.

The additional speed is achieved by tightly tuning AllBase to HP's operating systems. "It has better performance because it's engineered specifically for the HP hardware," explained Donald Feinberg, a senior software analyst at Gartner Group, Inc. in Santa Clara, Calif.

However, AllBase/SQL is bound to test the widely installed base of HP's Turbo Image database, even among all-HP shops, industry analysts said. Turbo Image, which is designed for high-speed transaction processing, has historically run faster than AllBase.

Only XDB products make your PC work like a mainframe by giving you 5 ways to put DB2 power on your desktop. And when we say power — we mean it. All XDB products have one thing in common...100% DB2 compatibility.

XDB lets you develop COBOL programs with XDB-Workbench and QMF reports with XDB-QMT on the PC, and run them on the mainframe. XDB also gives you XDB-SQL to build SQL-based Windows or 4GL applications.

Your XDB applications can run standalone or against an XDB-Server. They

can even reach out and talk to DB2 on the mainframe through XDB-Link. With DRDA and RPC support.

Most importantly, as you add desktop tools and client-server technology, you don't end up with incompatible systems. Everything follows the DB2 standard.

This means XDB provides powerful features like full SQL syntax and system catalog, referential integrity, transaction processing, concurrency control, and security — just as DB2 does.

Only XDB provides this power across DOS, OS/2, Windows and UNIX plat-

forms. XDB also lets you choose from over 50 front-end tools — provided by industry leaders like Interact, KnowledgeWare, Lotus and Powersoft.

So call 1-800-488-4948 ext.505 to find out why over 25,000 corporate users have chosen XDB to satisfy their hunger for DB2 power. Tell us which way you want to put DB2 power on your desktop.

Informix extends 4GL technology

BY JEAN S. BOZMAN
CW 10/97

MENLO PARK, Calif. — Informix Software, Inc. packed a little flexibility into its fourth-generation language (4GL), last week, announcing four extensions to its 6-year-old Informix-4GL application development language, including a graphical user interface (GUI).

Analysts said the extensions came just in time because Informix's character-based 4GL was viewed as an aging technology and a weak point in the \$179 million firm's product line.

The following are the new extensions to Informix-4GL:

- **Informix-4GL/GX**, a 4GL that lets users deploy applications on either character-based or GUI-based screens. Pricing starts at \$1,280.
- **Informix-4GL for ToolBus**, a version of 4GL that can be dropped into Informix's ToolBus "framework" for third-party computer-aided software engineering tools and development tools. The ToolBus technology was obtained under license from Hewlett-Packard Co. The base price is \$1,200.
- **Informix-4GL/RF**, a version of the development language that can be used to program applications for handheld, DOS-based terminals that communicate using radio-frequency. Pricing starts at \$1,850.
- **Informix-TP/Toolkit**, a version that resides application code to run under a transaction monitor. The base price is \$500.

"Informix filled a big hole in their strategic portfolio," said Neal Hill, a senior software analyst at Forrester Research, Inc. in Cambridge, Mass. "Now they've got all the key building blocks on the tool front."

Some large Informix sites were pleased to see the new software, particularly the new support for graphical workstations and the module that supports online transaction processing monitors such as NCR Corp.'s Tuxedo. It will be adapted to support NCR's Top End and Transarc Corp.'s Encina.

Hyatt Corp., for example, based its hotel reservation system on AT&T (now NCR) hardware and the Informix relational database.

All products are currently shipping except for the Informix-4GL/RF, which is scheduled to be available later this month.

Borland gazes through Windows

CONTINUED FROM PAGE 1

catch-up with year-old initiatives from rivals Microsoft and Lotus Development Corp. targeting corporate accounts.

On the product side, Kahn has promised he will not be stingy with the whip in taking his \$500 million firm into the Windows battle against behemoths Microsoft and Lotus. He has vowed to ship by the end of this summer Windows versions of the Paradox and dBase databases and Quattro Pro spreadsheet as well as a half-dozen more updates and introductions.

"We eat and sleep Windows these days," said Kahn, who clearly sees Windows as the future of Borland. Company insiders said the firm recently turned down a \$3 million job from the U.S. Army for a simple port of an application to run on their Unix network. Kahn refused, fearing it would dilute the focus of programmers who were concentrating on Windows work.

Trouble is, users are wondering if the singularly driven Kahn is losing touch with what they want and what they need: a broad range of applications to accommodate their multivendor platform (see story below). "I just hope Borland doesn't make us a victim of their ambitions," said Bob Smiley, lead systems analyst at Matson Navigation Co., a shipping firm in San Francisco.

"I wish they'd just expand on their places instead of trying to take on everyone in town," said John A. Coyle, a dBase user and chartered life underwriter at Equitable Financial Cos., in Huntsville, Ala.

Will may come true

Coyle may, in fact, get his wish. After 18 months of graining Windows with every bone in its body, Borland's enthusiasm may be waning. And for good reasons. First, the company has had difficulty meeting self-imposed — and much-ballyhooed — Windows products ship dates.

This has not been an easy thing to digest for a company that prides itself on the quickness to market that its object-oriented application development techniques afford. The lack of Windows products was cited as one of several reasons behind a \$26.9 million decline in Borland's bottom line during its fiscal fourth quarter.

Even more ominous, however, is Microsoft's purchase of Fox Software, and its plans to release a Fox-developed Win-

dows database as early as this month. After grabbing the mental high ground, with constant snarky peaks at its upcoming Paradox for Windows, Kahn is faced with his worst nightmare: Microsoft beating him to market with a Windows database.

Already, officials are downplaying the role the graphical user interface will play within Borland. Spokeswoman Sandra Hawker said Borland is an oper-

product is incompatible with its DOS-based predecessor. "You can't port code over," Smiley said. Another beta-test user added, "If you run Paradox for Windows, you have no shot of it running with Paradox for DOS."

Similar painful stories are coming out about alpha copies of Borland's dBase compiler. "It's got some neat stuff, but they did a silly thing and left out the screen painter and report wit-

Kahn's latest pig is a mission to have Borland employees 'eat and sleep Windows' to fight rivals Microsoft and Lotus and ship late products

ating environment agnostic. She also cited data from Indoparc, a San Jose, Calif.-based research house, that nearly 50% of the IS community has no plans to move to Windows — ever.

Also troubling on the Windows front are early reports from beta-test users that upcoming Windows packages may be less than ideal. "Borland is focusing a lot of energy on delivering product fast, but not complete," Smiley said.

Beta-test users of Paradox for Windows also indicate that the

er," said George F. Goley IV, president of Micro Endeavors, Inc., a consulting and training firm in Drexel Hill, Pa. A similar faux pas hurt Lotus' sales of 1-2-3. Borland said this slipup will be fixed by the time the product ships late this year.

"The incompatibilities are a matter of no small concern to users. 'We count on these new up-graded packages to be similar because we've got a lot of time and training invested in using and integrating them,' said Roland Murphy, an engineer at the

Resources Conservation Co. in Bellevue, Wash.

Borland is seeking to take advantage of that investment in other ways as well. Next month, the company will roll out several sales and marketing initiatives, coupled with account visits from top company executives, in a bid to bolster Borland's visibility with IS managers (CW June 15).

The company is attempting to rectify the situation with a series of programs that include volume licensing agreements, educational seminars and having executives "adopt an account."

Down to business

"Borland has had a hard time building a direct sales force. They need to do this. As the desktop becomes the fundamental base layer of the corporate computing pyramid, they need to get on the short list of MIS or else they could find themselves focused out of some very large accounts," said Neal Hill, a senior analyst at Forrester Research, Inc. in Cambridge, Mass.

In addition, Borland does have plans for other platforms. The Unix strategy focuses around Interbase. For example, the features of the Paradox database engine and Interbase have been merged to create an enhanced database engine called Interbase Local Engine.

The Interbase database engine offers users an alternative to the Unix-based database servers and will serve as the common database engine for the Windows versions of dBase and Paradox. Borland said Paradox and dBase will be able to share data when the Windows versions of each ship later this year.

"It sounds great on paper, but I'll hold my judgment until I see something happen," said James Ramsey, a dBase user at the San Francisco police department. Borland also plans to continue DOS upgrades on all applications.

Jack Detrick, director of data processing at Centinella Hospital in Los Angeles, said scrapping dBase completely would be a mistake. "I've got a lot of dBase applications running here at the hospital, and I'm not about to... say we're going to convert them all to Paradox," he said. Instead, he said he would be amenable to a merged product using the dBase programming language and the Paradox interface.

Borland officials also said they plan to support IBM's OS/2. The firm recently unveiled Objectivity for OS/2 and plans to support C++ under OS/2. The company is also expected to announce its Windows New Technology strategy later this week. Let another thorn in Borland's side is a lengthy copyright suit with Lotus that has yet to be resolved.

By year's end, users should have a slew of new products and some outreach programs to mail over. While Kahn basks in the scrappy start-up days of old, his user base will be watching very carefully to see if Borland has matured into the kind of reliable, broad-based and IS-minded company they need to grow with.

Helping hands

Borland CEO Philippe Kahn is heavily invested in the idea that he would like to continue partnering with other companies. "We're willing to help our competitors, even if it does mean giving away some technology."

This strategy may include a linkup with Novell, Inc., although that move might only be used to score off a common enemy: Microsoft.

"There is an old saying that the enemy of my enemy is my friend," said Daquost, Inc. analyst Paul Cabbage. "Borland (application) and Novell (networking operating systems) face a very real threat in Microsoft."

There is also talk that Borland may help provide tools for the forthcoming object-oriented operating system from Taligent, Inc. the joint venture between IBM and Apple Computer, Inc.

In parallel with this, Borland will roll out the first of a half-dozen planned partnerships with systems integrators as it strives to raise its profile among IS managers.

JAMES DALY

Users put Borland on notice

According to Borland users, the firm faces a number of challenges in the next year, chief of which are the following:

- **Retain the loyalty of former Ashton-Tate Corp. customers,** many of whom became nervous when Borland talked about converting them from dBase to Paradox. Borland has since backed off that strategy, but its competitors are looking to capitalize on the confusion.
- **Provide easy-to-use front-end tools that allow users to perform personalized database services and access data on larger systems.**
- **Continue the frontal assault on Microsoft's systems business.** There are rumors that Borland and Novell, Inc. are collaborating on a strategic client-server marketing strategy that might allow Borland's Interbase engine to be built into Novell's NetWare.
- **Make the tutorials easier to use.** "We're getting very complex and leaving a lot of people be-

hind," said John A. Coyle, a dBase user and chartered life underwriter at Equitable Financial. "It's one thing to bring out a new product. It's another to get it used."

- **Move on hints that it is working with Apple on a database.**

In particular, those rumors have been warmed by users struggling to bridge interoperability gaps inherent in many multipatform environments. They would like to see Borland take advantage of the graphical Macintosh interface; make it a relational, rather than a flat-file, database; provide connectivity to Paradox for DOS and Paradox for Windows; provide a feature similar to SQL Link, a Paradox Version 3.5 companion product that allows users to access remote SQL data without learning complex SQL programming; and leverage client/server connectivity to Interbase, which offers a relational database management system for multiserver environments.

WHAT, EXACTLY, IS ACCEPTABLE RISK?

Last night you powered down a cholesterol-rich pasta with cream sauce. This morning you jaywalked across a busy four-lane street, and next weekend you're going to trust some nineteen-year-old who tells you there's no way the bungee cord can break.

Next to that, choosing new computer equipment is merely career threatening.

We don't think it should be quite so risky. Which explains the existence of NetWare, Novell's networking software that unites such strange bedfellows as IBM and Sun, Oracle and Microsoft.

NetWare not only preserves investments you've made, it'll accommodate whatever decisions you make next year. Our eighth generation products are the result of alliances we've built with over 2500 software, hardware and systems vendors, who've designed and tested thousands of their products to work with ours.

Which means you really only have to ask one question to make your next risk an acceptable one. "Does it run with NetWare?"

The Past, Present, and Future of Network Computing.

FOR MORE INFORMATION, CALL 1-800-NETWARE.

ADVANCED TECHNOLOGY

TECH TALK

Smart food

■ No, you can't eat this one and it doesn't build strong bodies, but it could build smart computers. One of the experiments scheduled to be carried out on the flight of the space shuttle Columbia, launched June 25, involved a smart protein believed to have potential as computer memory material. Several educational institutions and companies were sponsoring the research into the commercial viability of the light-harvesting protein bacteriorhodopsin in computer memory applications. Researchers hope the material can be used in the future to build optical three-dimensional memory storing 18G bytes of information in a storage device measuring only 5 cubic centimeters.

Real deal

■ Cray Research, Inc. and Modular Computer Systems, Inc. (Modcomp) have signed an agreement under which Fort Lauderdale, Fla.-based Modcomp will license its REAL/IX real-time operating system technology to Cray. The companies plan to collaborate in developing system software to support real-time applications on the Cray Y-MP EL supercomputer. Cray also announced an agreement with Applied Dynamics International, Inc. in Ann Arbor, Mich., under which Cray and Applied Dynamics will develop and jointly market real-time computer simulation products.

Raising Arizona

■ Attempts to simulate the growth of semiconductor crystals are under way at Arizona State University. The school recently installed a Chaves Computer Corp. C3400 supercomputer to facilitate growth of crystals for silicon and gallium arsenide semiconductors. The computer will attack equations of theoretical physics to predict physical and chemical reactions as new super chips are developed. It will then produce a videotape of super chip growth.

Letting the robot take the plunge

AT&T sonar system scans ocean floor for lost cables and buried treasures

BY ELIZABETH HOGWITT
LAS VEGAS

Searching for things on the ocean floor can be a frustrating and time-consuming job, whether the object in question is a lost fiber-optic cable segment, an oil pipeline or a canister full of radioactive waste. But a digital sonar device developed by AT&T may change all that. It is expected to cut by 50% the total time it takes to locate lost and severed cables.

For example, according to Bob Bannan, a senior engineer at AT&T who directed the project, it currently takes AT&T two to four hours to locate a lost cable, depending on weather and sea conditions.

Current cable-finding technology includes devices that sense a cable's magnetic field and analog sonar that bounces analog waves off the ocean floor and analyzes the resulting echoes. Unfortunately, magnetic sensing generally misses the small-diameter fiber-optic cables on which international data communications often rely. Meanwhile, analog waves tend to be absorbed by the boulders, rocks and gaseous clays on the ocean floor, Bannan said.

Chirping away

In contrast, an AT&T Bell Laboratories-patented technology called digital signal processing sends digital pulse "chirps" that pierce through rock and clay to locate objects far more quickly

and accurately, AT&T said. AT&T has incorporated this technology into a prototype system called Enhanced Bottom Sonar System (EBSS). The system rides in a remotely operated vehicle (ROV) that travels underwater sending out digital chirps. The chirps bounce off the sea floor, and the return signal is

spotted on the ocean floor.

Although the device was developed to find lost cable segments, the technology might also be used to find "special objects," such as the black box from the Air India plane that went down off the coast of Ireland or even gas pockets or rock strata with oil for the energy industries, Bannan said.

Underwater progress

"Everything we've seen to date shows that this is one of the most promising technologies for locating things underwater to come along in years," said Gadi Gidyelev, manager of government and commercial programs at Oceanering Technologies, which has given AT&T input on the application of digital sonar.

Oceanering Technologies has concluded that EBSS "has a demonstrated ability to locate continuous things like cable and oil pipelines," Gidyelev said. "Once it is produced, we would be very interested in buying it" as an aid in the company's work for oil and gas companies.

On the other hand, digital sonar has yet to prove its ability to locate isolated objects, such as canisters or rock strata that contain oil, Gidyelev said. "Working underwater is a tricky, difficult process."

AT&T is using EBSS in its own cable recovery services. The company has no time frame for announcing commercial availability, Bannan said.

The next phase of the EBSS project is to miniaturize the system so that it can be installed in smaller ROVs.

John Gower

picked up by the system, which converts it into digital information.

"You see various contours [of the sea bottom], and when [EBSS] sees something lying on the surface, it gives you an acoustic signature," Bannan said.

The ROV system sends information to a shipboard AT&T Intel Corp. 1486-based StarServer 5 workstation, which refers to a library of signatures to determine what type of object has been

Applications become clearer with fuzzy logic

BY CHRISTOPHER LINQUIST
CHICAGO

Very little in life is black and white, but computers have a tendency to make us solve problems that way. Now, Knoxville, Tenn.-based FuzzyWare, Inc. is producing fuzzy logic applications that circumvent some of the restrictiveness of traditional binary solutions.

FuzzyWare's products, such as FuzzyQuote and the soon-to-be released FuzzyCalc, allow users to establish "fuzzy" values for activities such as determining the per-piece price on manufactured goods. Users can input hard data, such as costs of raw materials and tooling, and then add fuzzy values for such things as "How much do we want this job?" and "How busy are we at the moment?" The effect of fuzzy information on the equation is determined by historical data, embedded knowledge from experienced employees and "current insight" into the situation at the

moment the quote is made.

The result is an accurate quote made in less time than would normally be required to pass proposals in front of all the required employees and shorter response times to customer requests.

"With our quoting, a lot of the numbers that we would come up with were best guesses," said Laney Fowler, vice president of sales and marketing at Foremost Manufacturing Co., a formed metal fabricator in Union, N.J. FuzzyQuote allows the firm to input ranges instead of crisp numbers and include abstract information.

FuzzyQuote also eliminates the need for the company to gather all its employees with quoting experience each time a bid has to be calculated.

FuzzyCalc takes the fuzzy logic idea even further into the realm of general use. Users are presented with a com-

mon Windows-based spreadsheet interface into which they can add both hard and fuzzy data. Fuzzy numbers are represented by a chart that can be directly manipulated by the user. Users can pick a range of acceptable or probable answers and also establish a "desirability" level from "0" (unacceptable) to "1" (totally acceptable).

For example, an application that might be used to determine possible cities for a new plant might include such factors as city size, number of available airline flights and temperature. By adjusting a graph for each factor, a user might indicate that cities having between 500,000 and 3 million residents, at least 15 flights per day and an average temperature of 50 to 70 degrees Fahrenheit are suitable.

FuzzyCalc will be available later this summer for a list price of \$995.

Fuzzy logic

**DELL INTRODUCES A CONCEPT
SO REVOLUTIONARY, IT BREAKS
EVERY LAW IN THE BOOK.**

**MURPHY'S
LAW**

If something can go wrong, it will.

That's a law so fundamental, it's practically built into every brand of computers on earth. Fortunately, you've told us how to make it better.

In the course of millions of conversations with our customers, we discovered what bothers you about buying and owning computers. One theme was sounded over and over: It's not just a great computer you want; it's what we can do to make sure you'll get the most out of your computer.

Based on millions of conversations with our customers, we've made dramatic additions to our services to help you get the most out of your computer.

So we studied every area where we could help, from hardware to compatibility, from telephone response to service. The result was some fairly dramatic changes at Dell to make computing easier now, and in the future.

We added new services and specialists so you can get faster help. We involved our suppliers and software developers to find new ways to ensure compatibility. Most important, in the three key areas where you want assurances—compatibility, quick answers and fast service—we're offering something completely foreign to other computer companies: guarantees.

We're offering something no other computer company offers: guarantees.

HOW CAN A COMPUTER BREAK MURPHY'S LAW? We started with state-of-the-art technology. Integrated 1024 x 768 VGA support, for instance, is included on all Dell desktop systems—even our entry-level i386™SX system. For BIOS upgrading, all i486™ systems have FLASH EPROMs. The SmartVu™ diagnostic display and programmable reset switch are standard on both the mid-sized and floorstanding systems. And to make sure you get exactly what you want, every system can be custom-configured to your specifications.

We've also implemented what we call the "total ownership experience." We added specialists to help you with each step you take in owning a computer, from purchasing to set-up to servicing to upgrading. You can expect quick answers from our unique Getting Started Helpline®, custom integration services, award-winning phone support, and our 24 hour-a-day TechFax™ lines for system information.

IRON CLAD GUARANTEES. We know you want your Dell system to be compatible with new products in the future. We know you want quick answers to your questions. And we know you want fast service.

So we guarantee you'll get all of it. This isn't a promise, it's a guarantee. You can read about the guarantees in the following pages.

They should make everybody happy. Except maybe our competitors. And Murphy.

Every Dell i486 system has FLASH EPROMs for easy BIOS upgrading.

THE ONLY
PRODUCTS
YOUR
COMPUTER
WILL NOT
WORK WITH
ARE THE ONES
YOU REALLY
NEED.

INTRODUCING GUARANTEED COMPATIBILITY.

For particularly tough situations, we can rewrite parts of the BIOS for you.

We guarantee we'll work with you to ensure compatibility with products introduced in the future.

We constantly create compatibility situations that will "break" the system, then find a way to make it work—so you don't have to.

We've discovered a common phobia among computer shoppers. They're afraid the computer they're about to buy won't run everything they'll need in the future.

At Dell, one of our main goals when we design systems is compatibility. We have a state-of-the-art lab where our engineers do nothing but make sure our computers run other vendors' products. We configure our systems with third-party boards and hundreds of packages in virtually every possible permutation. With thousands of configurations behind our computers, we often find situations that will "break" the system. Then we find a way to make it all work, so you don't have to.

We also have strategic relationships with the people who make those new products. For example, if you have a problem with system software from Novell, Banyan, SCO, Microsoft or IBM, we'll use our alliances with these companies to bring everyone together to solve your problem.

WHAT ABOUT NEW PRODUCTS? As we said, our systems are designed to be compatible today and tomorrow. But if a new product is released, and your system is not compatible, we can provide free BIOS changes, if that will make them work together. For complex situations, we can modify the BIOS for you. And for the particularly tough problems, we have specialists in areas such as networking, UNIX[®] and graphics. No one can predict the future. But we'll do everything we can to make your system compatible as quickly as possible.

DOESN'T ANYONE ELSE GUARANTEE COMPATIBILITY? In a word, no. Oh sure, you could probably squeeze a few vendors for some compatibility assurances. But when you try to get them in writing, they're a bit tougher to get.

OUR COMPATIBILITY GUARANTEE: Dell systems are designed and tested to run all standard operating systems, application software, peripherals and network operating systems developed for ISA and EISA architecture systems. If you encounter a compatibility problem with your Dell Performance Series system within three years of the original purchase, we guarantee Dell's engineers and technicians will work with you to identify the cause of the problem and recommend a solution. If the problem (other than software support for device drivers) can be solved by updating your system, we'll provide the change at no charge. Or, in the rare event we can't do that, you may return the system for a refund. You understand that we can't extend the guarantee to software or devices that were never intended to run on comparable ISA or EISA systems of the same vintage.¹

DELL
800-626-9534

¹Refund value is based on the ratio of years after depreciation of the original purchase price over software cost divided by calendar months. Refund offer is valid for original owners of Dell Performance Series systems purchased after July 1, 1992. Customers not applicable outside the U.S. and subject to change without notice.

MURDER

THE MORE
DESPERATE
YOUR PHONE
CALL, THE
LONGER YOU
WILL BE PL
ON H

INTRODUCING GUARANTEED RESPONSE.

Having trouble formatting your hard disk? Need somebody to explain the mysteries of MS-DOS 5.0? Can't set your modem switch?

If you have a Dell computer, you can call us and get all the help you need without umpteen call transfers or endless choruses of "Tie A Yellow Ribbon." We've put together a remarkable system that enables our trained technicians to solve most reported problems over the phone, usually in 10 minutes or less.

It works like this: Calls made to Dell Technical Support are entered into our system. If our technicians run into a problem they can't solve, they access the Problem Resolution Database. Chances are a similar problem—and solution—have been entered in the past. We also keep a complete history of your own computer. Over time, we'll get to know your system as well as you do. Maybe even better.

And the price of your system includes 7 day-a-week, 18 hour-a-day,* toll-free phone support for as long as you own your Dell computer.

We solve most problems over the phone within 10 minutes.

24-hour system information is available on our TechFax Line.

THE DELL WHATEVER-IT-TAKES APPROACH TO CUSTOMER SATISFACTION begins the moment you receive your computer. For the first 30 days, you'll have a special toll-free Getting Started Helpline* staffed by people who speak plain English, not Fortran. If you need system information, it's available 24 hours a day via our innovative TechFax line. Just dial up and the detailed information you requested will be automatically faxed to you from the Dell Technical Library. We also have our own Dell Forum on CompuServe's Information Service so you can see other users' problems, and more importantly, our solutions.

All these services haven't gone unnoticed by our customers. We've won PC Week's Customer Satisfaction Poll an unprecedented eight times, won PC World's World Class Award for Best Service, and ranked among the top of PC Magazine's customer service and reliability survey.

OUR RESPONSE GUARANTEE: We guarantee when you call our technical support center with a problem during operating hours (6AM-12 Midnight CT daily)* you will talk to a technical specialist within 5 minutes. If you do not wish to hold for a technician, we guarantee your call will be promptly returned by a technical specialist within one hour. In the rare event you don't reach a technician or a technician doesn't call back within one hour, let us know and you will receive your choice of a check for \$25 or a credit of \$25 toward your next purchase.²

DELL**800-626-9534**¹The guarantee begins August 1, 1992 and applies to registered owners of Dell desktop/laptop systems purchased after July 1, 1992. Not valid on leased systems or for Dell's service centers. Please understand that the guarantee does not apply to support calls received for routine hardware or software problems, or to calls made to Dell's support centers outside the U.S. Subject to change without notice.

THE MOST
URGENT THE
PROBLEM,
THE LONGER
WILL
BE FOR
SERVICE.

INTRODUCING GUARANTEED NEXT-BUSINESS-DAY SERVICE.

We heard what people had to say about service they've had elsewhere, and it wasn't very nice.

So instead of giving you the usual reliability story, we'll give you the straight scoop.

THE STANDARD SERVICE IS ANYTHING BUT STANDARD. When we find out you have a problem, a trained technician will be at your desk the next business day if necessary. The next-business-day service is backed by a \$65 million parts inventory. (That's probably ten times more inventory than most resellers' revenue.) It's also supported by an overnight parts shipment and a field service force that boasts hundreds of certified NetWare® technicians.¹

If our next-business-day service isn't fast enough for you, there is the option, in many areas, of upgrading to Critical Care,² 4-hour service.³

You can even sign up for these service commitments for as long as four years.

Think of them as long-term insurance against Murphy's Law.

HERE'S A NOVEL IDEA: WE'VE DESIGNED THEM SO THEY WOULDN'T BREAK DOWN. For added confidence, we design our systems from the ground up rather than rely on dubious imports. With quality components rather than the rejects some vendors pick up on the open market.

Every Dell system is tested for extremes of heat, cold, vibration and shock. It features specially designed air cooling systems to keep noise and temperature levels low. Highly integrated systems boards minimize the number of connections and parts, so there are fewer things to go wrong.

OUR SERVICE GUARANTEE: If there is a hardware failure with your Dell system while under a service contract purchased from Dell and you notify us before 5:00 PM CT, a technician, if needed, will arrive to address your problem by the end of the next business day. In the rare event the technician does not arrive as promised, let us know and your situation will receive top priority for resolution, plus you will receive an additional month of service at no cost to you.³

We guarantee a trained technician will be at your desk by the end of the next business day, if needed.

Every Dell system is tested for extremes of heat, cold, shock and vibration.

DELL

800-626-9534

¹The guarantee begins August 1, 1992 and applies to registered owners of Dell Performance Series systems purchased after July 1, 1992. Please understand that the guarantee does not apply to service calls received for reasons directly outside of our control, such as the misapplication of software or the misuse of equipment required for parts delivery or removal of the system. Subject to change without notice.

Hurrah for the 'Second Circuit'

PHILIPPE KAHN

If you follow the computer industry, you've probably read at least something about the issue of software copyrightability. Personally, I'm not much for reading legal briefs, but due to a number of companies that believe competitive battles should be fought in the courtroom, I have been forced to read more than my share.

This is a computer book, not a legal journal, so I'll spare you the legal jargon and just get right to the point: Right now, our industry is facing an issue that is absolutely critical to the future health of the U.S. computer industry.

Innovation has been the driving force that has made us a world leader in software. But that advantage is being threatened by companies trying to overextend copyright protection to guard their own interests.

Last week, the Federal Court of Appeals in the prestigious "Second Circuit" published a

landmark decision on the standards for copyright protection of computer software. The decision is a huge victory for everyone concerned with the future health of the U.S. computer industry.

Finally, the courts have made a strong statement to corporations that choose to use the legal system as a competitive stumbling block rather than competing with technological innovation and straightforward, aggressive marketing.

A matter of balance

In its decision, the Court of Appeals made it clear that the results reached by other courts on this issue were "less than satisfactory." In the case of *Computer Associates v. Altai*, the court issued a ruling that specifically "recommends 'the necessary balance' between creative incentive and industrial competition."

We were very pleased with the court's position that aspects of a computer program that are dictated by considerations of efficiency and factors external to the program itself or taken from

the public domain are not protectable.

The ruling reflects the basic tenets of copyright law, and this is a position that Borland has long held.

I believe that the most important aspect of the Altai decision is its clear declaration that "compatibility" is not a dirty word. The court stated that aspects of a program's structure that are "dictated by the nature of other programs with which it was designed to interact" are not protected by copyright legislation.

The court felt it was important to allow the distribution of a "compatibility component" of a computer program because that aspect "saves the user the costs, both in time and money, that would otherwise be expended in purchasing new programs, modifying existing systems to run them and gaining familiarity with their operation."

For those of you who follow Borland and use our products, the court's statement might look familiar, because it contains the essence of several advertise-

ments for our Quattro Pro spreadsheet.

We hope the importance of the Altai decision becomes clear to everyone in the industry and to all of our customers.

Much at stake

If these cases were to be decided the other way, they could seriously damage the large portion of the American computer and software industry — those companies lawfully engaged in the making of compatible products.

The Second Circuit's overriding concern was "the preservation of the balance between competition and protection." "The interest of copyright law," the court said, "is not simply conferring a monopoly on inquisitive persons, but advancing the public welfare through rewarding artistic creativity..."

Unfortunately, however, the battle does not end with the Altai case. We hope the Second Circuit's decision in Altai becomes a road map that other courts choose to follow, but unless and until the U.S. Supreme Court decides the issue, there is no requirement that they do so.

Kahn is chairman and chief executive officer of Borland International, Inc.

Call off the hostilities:
There's a lot of work to do

DAVID VASKEVITCH

Which would you rather have: style or substance?

Our mainframes contain large data-based applications that run off

complete reliability. Yet these applications have hostile front ends that make it almost impossible to find data quickly or integrate it into the spread-

sheets and word processors we've all grown to know and love. Desktop PCs offer slick, friendly applications that inte-

grate easily with all those tools. However, PC applications deal only with the data you type in or load from a floppy disk and provide no way to access the information the organization runs on.

Great choice: lots of substance but terrible appearance, or great superficial appearance but no underlying substance.

Desktop PCs offer slick, friendly applications that integrate easily with all those tools. However, PC applications deal only with the data you type in or load from a floppy disk and provide no way to access the information the organization runs on.

Great choice: lots of substance but terrible appearance, or great superficial appearance but no underlying substance.

development where even the suggestion that some data might stay in DB2 or IMS is viewed as religious heresy. And Cobol-based systems organizations actively look for inconsequential projects that can be built on LANs without getting in the way of any real applications.

What we have here are two cultures that, at best, just don't understand each other and, at worst, are sometimes at war.

When mainframe professionals talk about databases, they mean DB2, IMS and Rdb — storage and retrieval engines built to support thousands of simultaneous users while safeguarding data through power failures and disk crashes. But for PCs, databases are products such as dBase, Paradox and dBase.

workstation-resident development tools built for single users.

Supporting eight simultaneous users is a significant accomplishment for these lightweight engines, while integrity is generally defined in terms of being able to retreat to the last backup.

The two communities generally are not even talking in the same terms. What a PCer thinks of as a DBMS a mainframe

would call a 4GL. When it comes to database design tools, the cultural disconnect gets worse.

Mainframe-trainee, data-oriented developers have tools and understanding to build the

big, serious applications that contain the data our organizations run on. What about accessing that data, though?

Mainframe developers think in terms of 3670 screens and data entry fields — an environment where the central computer controls the entire interaction. To them, interface design means deciding the order in which the user moves through a relatively fixed set of static forms.

Concepts such as Direct Manipulation and WYSIWYG, which lie at the center of modern GUIs, have no meaning for mainframers. Just as PCers lack the basic concepts and experience to

think about database design, mainframe developers lack the fundamental framework to conceptualize, let alone build, truly graphical and friendly interfaces.

So we're left with two funda-

mentally different cultures, both critical to building the applications of the '90s.

This schism isn't going to be easy to close. The problem runs deeper than concepts, tools and vocabularies. Each group has an almost religious belief in the correctness of its own approach.

Fortunately, there's a saving grace: Scratch any dedicated computer professional and you'll find a hacker underneath. The challenge is to help each side see the promise and the value in what the other knows.

Vaskevitch is director of strategic services for Mc-mac Consulting Services at Microsoft Corp. in Redmond, Wash.

**Show me a new workstation
with better numbers, and you'll
get my attention.**

**Show me one with better ideas,
and you'll get my order.**

Introducing SPARCstation 10.

The new SPARCstation™ 10 system is four times more powerful than any workstation we've ever made.

Not only that, we also think you'll find it a hundred times more interesting than any workstation anyone else has ever made.

More interesting, because it runs your applications better than other desktops. Because you can upgrade to future processors about as easily as you can change a light bulb.

And because it doesn't trade off backward compatibility for the sake of forward thinking.

In other words, the Sun® SPARCstation 10 is not just a new model.

It's an entirely new computer.

The only performance that matters.

With each of the SPARCstation 10 models, ranging from 86 to over 400 MIPS, you'll find we've asked a single question:

What good is a turbo-powered engine if the car's transmission is sluggish? Or if its tires are flat?

Our point is that building faster CPUs makes very little difference if the rest of the computer can't keep up.

So the SPARCstation 10 possesses not only a faster CPU, but also a faster system bus, faster input/output, faster networking, and built-in multiprocessing.

The faster CPU is our remarkable — and reassuring — new SuperSPARC™ chip.

Reassuring, because SuperSPARC is binary compatible with previous generations of SPARC®. It runs the Solaris® operating environment, too, so you can use thousands of existing applications.

And remarkable, because SuperSPARC can handle three instructions at once (most others manage only one or two). Imagine what that does for sheer processing speed.

Now here's where things really start cooking:

We teamed all that horsepower with the extra performance of multiprocessing. One megabyte of SuperCache™ memory. A 320-megabyte-per-second peak memory bandwidth. A 10-megabyte-per-second SCSI disk controller. And a large I/O buffer for faster Ethernet transfers.

Individually, each of these represents a big step forward in computing performance. But together they produce an astonishing leap ahead in application performance.

And to the person whose hands are on the keyboard, that's the only kind that matters.

Growing up vs. growing old.

Though budgets have never been tighter, most workstations are still designed around the wasteful belief that you're willing to replace last year's computer just to work with a newer processor.

The SPARCstation 10 was designed around a different philosophy:

Make the processor replaceable, not the workstation.

To that end, we put the processor on a small SPARC module that plugs into the motherboard. As faster chips become available, you can upgrade by pulling out the old card and plugging in a new one.

The rest of your investment — memory, storage, accelerators, everything — is left intact.

But don't feel you have to wait around for faster chips. You have the freedom to grow a SPARCstation 10 in plenty of ways right now.

You can start by plugging in a second SPARC module. Since this machine was engineered throughout for symmetric multiprocessing, you'll nearly double its processing power.

You can also boost its memory to 512 megabytes. And its disk capacity to 26 gigabytes.

There are ports for both parallel and serial devices; connections for thick, thin, or twisted-pair Ethernet; even ISDN connectors for networking over public telephone lines. All built in. Which leaves its four expansion slots available for other functions.

To sum up, we hope you like the way SPARCstation 10 looks on your desk.

Because it's going to be there quite a while.

The future is not an option.

As innovative as computer companies try to be, they usually can't keep up with what people like you are ready for.

For instance, how long have you been hearing about promising new technologies like multiprocessing? Multimedia? ISDN?

And how many workstations can you name that give you every one of those capabilities, right out of the box?

There's only one.

You've already read how the SPARCstation 10's multiprocessing can speed up the applications you run today. But it also means you can add enough horsepower later to run next-generation software built around multithreading and object management.

And then there's ISDN. It brings the worldwide telephone network directly into the Sun SPARCstation 10 — without modems or other gadgets. Which allows applications to make faxing, voicemail, and even video conferencing as natural as printing.

A 16-bit audio chip and external speaker are also included. So applications can use CD-quality sound for e-mail, spoken tutorials, and multimedia presentations.

And there's enough memory, disk space, and bus bandwidth to meet the enormous demands of animation, simulations, and real-time video.

Oh sure, there are plenty of options you can add to this computer.

The future, though, is standard equipment.

Admit it, you're intrigued.

You can't have read this far without feeling at least a twinge of excitement.

Maybe it's for the swift kick-in-the-pants this machine can give to the applications that you're already running today.

Or the enthusiastic way it welcomes whatever new technologies may be around the corner.

Maybe you simply can't help but respect a computer that offers your business a lot more, than just MIPS and MFLOPS.

Whatever you think, here's what to do:

Call 1-800-426-5321, ext. 485 for complete information on the SPARCstation 10, or the name of your Sun reseller or sales representative.

It's the first workstation to combine such powerful numbers with such potent ideas.

If a new PS/2 56 or 57 interests you, running twice as fast on one should, too.

Application	Test	PS/2 56/57 w/ 4MB RAM w/ Windows 3.1 & MS-DOS 5	Standard configuration PS/2 56/57 w/ 4MB RAM w/ OS/2 2.0	Times Faster
Microsoft Excel 4.0 for Windows	File Load	Time in seconds 73	Time in seconds 53.8	74
Lotus® 1-2-3® for Windows	Application Load	21.5	134.8	6.3
Ami Pro® 2.0 for Windows	Print	18.0	110.0	6.1
WordPerfect® 5.1 for Windows	Spellcheck	12.7	264	2.1

If you're like most people, you probably use applications for the Microsoft® Windows® operating system. But if you happen to get the standard configuration PS/2® 56 or 57 with OS/2® 2.0 these days, you might notice that your programs run at substandard speeds.

What's the solution? New Microsoft Windows & MS-DOS 5 for IBM® PS/2.

We've combined MS-DOS 5 and Windows 3.1 in a single installation specifically designed for the IBM PS/2. Which means you can run most of your

applications for Windows twice as fast, and in many cases over five times as fast, as the standard configuration PS/2 56 and 57 allow.

Through 1992, the Windows and MS-DOS 5 package is \$149.95.* It's easy to install for yourself. Or ask your IBM reseller to install it for you on the new IBM PS/2 of your choice.

To get the facts on Windows and OS/2, give us a call at (800) 541-J261, Department HG8. We'll be happy to help you get up to speed.

Microsoft
Making it easier

*This measure performance on operations commonly selected by industry publications, including PC Magazine, InfoWorld and PC WEEK, for evaluation of word processing and spreadsheet applications. Actual test files and compare to descriptions contained in PC WEEK's evaluation. Test runs performed by an independent third party. Spreadsheet File Load. Time from execution of file open command to last user requested window at the application. Based on loading a file with 100 records of text and labels. Spreadsheet Application Load. The time a table is loaded on application. The time from when the user first double-clicks to where the user requested control of the application. Under the OS/2 test, the time also measured based on beginning from an OS/2 desktop. Word Processor Print. The time it took to print a one page document containing ten full columns and a full page. The test was repeated three times. The first repetition was discarded and the user requested control of the application. Word Processor Spellcheck. Time required to spellcheck an OS/2 page document with no spelling errors. The test was repeated three times. The first repetition was discarded and the user requested control of the application. Under the OS/2 test, the time also measured based on beginning from an OS/2 desktop. In Canada, call (800) 541-J261. © 1992 Microsoft Corporation. All rights reserved. Printed in the USA. DESKTOP COMPUTING

PCs AND SOFTWARE • WORKSTATIONS

Undercutting Compaq: NEC joins the fray

BY CAROL WEILDEBRAND
CHICAGO

Another predator has joined the price-cutting fray, following Compaq Computer Corp.'s landmark product-price blitz in mid-June.

NEC Technologies, Inc. announced across-the-board price reductions on its entire families of PowerMate desktop, Ultra-Notebook and ProSpeed laptop computers.

The company, in another nod to the Compaq announcement, will provide free one-year, on-site service for the desktop machines.

Not premeditated

Michael Everett, marketing manager for desktop systems at NEC, acknowledged that Compaq's actions were the reason for NEC's follow-up. "We were not planning on cutting prices before that Compaq announcement," he said.

Everett echoed analysts' predictions that the collapse of the price umbrella previously held up by Compaq, IBM and Apple Computer, Inc., would drive many smaller competitors out of business.

"If we were a company that didn't have the financial resources of NEC, it would be very difficult out there. The more marginal manufacturers are going to be the ones that lose. They need economies of scale and manufacturing," Everett said.

He also said NEC has now cut its product cycle down to six to eight months, which is another critical factor.

Beating the competition

NEC prices dipped to an average of 5% to 10% below Compaq's. For example, NEC's PowerMate 486/501 with a 120MB-byte hard drive is now \$2,749, a \$950 price cut. Compaq's similarly configured model is \$3,669, Everett said.

In the PowerMate family, prices now range from \$1,099 for a 20-MHz 80386-based model with a 60MB-byte hard drive to \$7,749 for an Extended Industry Standard Architecture-based 50-MHz 486-based box with a 535M-byte hard drive.

Notebook systems dipped as low as \$2,199 for an Ultralite SL25C, while a 486SX ProSpeed laptop is now priced at \$4,799.

Step by step, bank moves 1,500 to OS/2

Huntington Bancshares' implementation plan calls for full conversion to OS/22.0 in 18 months

BY ROSEMARY HAMILTON
CHICAGO

COLUMBUS, Ohio — It starts with a group of 10, expands to a group of 500 and will eventually spread out to close to 1,500 users.

That is the easy way to explain Huntington Bancshares, Inc.'s deployment of IBM's OS/2 2.0. But the actual implementation process involves far more time, energy and patience, according to Cary Serif, manager of applied technology at the bank.

To make the shift to 2.0, Huntington put together the following plan: Work with a small group of users to determine migration and training issues.

Once the issues are established, move ahead with 2.0 installations based on priority software projects at the bank.

At the same time, individual users can request upgrades to 2.0, but "the first priority is projects," Serif said.

"With respect to the end users, we are having monthly meetings to show people what 2.0 is all about," Serif added.

"The deployment is driven

more by the bigger projects in the bank," Serif added, "if it's considered a critical application, then it gets priority."

500 ahead

Two projects topping the list are "Technically, 2.0 once the tests are completed with the group of 10."

When IBM shipped the final version of 2.0 in March, Huntington put together the small test group to determine what its users would need for support and training.

Testing is still under way, and Serif could not say when it would be wrapped up.

So far, the test group has shown that for end users to receive satisfactory performance for 2.0, each workstation will require about 8MB bytes of storage.

Technically, users could get by with 4M to 6M bytes of storage, but "we don't want to put

2.0 up and have people impacted because they don't have enough memory," Serif said.

Also, many desktops at Huntington are 80286-based and will need to be boosted up to 80386-class systems, which Serif said may be done with add-on boards.

THE DEPLOYMENT is driven more by the bigger projects in the bank... If it's considered a critical application, then it gets priority."

CARY SERIF
HUNTINGTON BANCSHARES

With these hardware upgrades rolled in, Serif estimated that the average upgrade will cost about \$1,800 per system.

The test group includes a mix of Microsoft Corp. DOS and OS/2 1.3 users so the bank can determine what the different migration and training issues will be.

In addition, among the 10 are users from various pockets of

the company so the bank's population is fairly represented.

So far, the group has shown that DOS and 1.3 users will require a good deal of support, in part because 2.0 opens up so many new options for them.

"Because 2.0 is so much more functional than 1.3 or DOS, there's going to be a lot more questions," Serif said.

Subtle persuasion

DOS users may still need a little convincing that 2.0 could help boost their productivity, Serif said.

"The attention with the DOS people is to help really open their eyes," he added. Huntington's Information Resource Center recently completed a 2.0 training program to be ready to assist end users.

As testing continues with the group of 10, Serif said, the 500 users on the branch banking project are a top concern. "This group has a little more priority, because it's a very important project to the bank."

Finally, Serif said, he expects 1,000 to 1,500 end users will be up and running with 2.0 within the "next 12 to 18 months."

The portable that had to fit in the sales rep's purse

BY MICHAEL FITZGERALD
CHICAGO

SAN FRANCISCO — Sales representatives at Pacific Bell Directory let their fingers do the walking — on a keyboard from Fujitsu Personal Systems, Inc.'s Poquet computer.

Two motives drove the choice of the 1-pound portables: a management mandate to bring technology into the business and "sales representative's desire to have a computer that fit in her purse."

"To me, we could provide more information much easier and in the process could increase our accuracy because everything would be more up to date," said Stuart Graham, then director of operations and sales support.

Updates to sales data, which were done quarterly with a paper system, as well as periodic specials, occur monthly with the computerized systems, Graham said.

The Poquet project became an

offshoot of a four-year, \$200 million project aimed largely at the internal telemarketing group.

"Upper management said as a company we had to [automate] since we're moving into a technological era," said Bill Bozym, an information systems planning and technology assessment specialist at Pacific Bell Directory, a subsidiary of Pacific Bell.

The search for small systems came from practical reasons. "These sales reps carry around a lot of stuff with them, and one female manager said she wanted to be able to put the computer in her purse," Bozym said. The Poquet machines measure roughly 8½ by 4½ in.

So Bozym pulled out his microscope. He looked first at Atari Corp.'s Portfolio computer and, after building a prototype on it, got feedback that its 8-line, 40-character display was, in fact, too small. Then he turned to the Poquet, which displays 25 80-character lines.

Continued on page 42

Bill Bozym, Project leader

Pacific Bell Directory, San Francisco

• **Challenge:** To provide an effective yet extremely lightweight computer to sales representatives who are forced to heft numerous paper-filled binders.

• **Technology:** Fujitsu Personal Systems' Poquet, Borland's Paradox database, a proprietary database.

• **Impact:** Full impact yet to be measured, but six months after rollout, 40% of the reps use the technology heavily and 80% say it improves their ability to make sales.

A Salute To The

Next Generation.

There's one lesson we should never forget.

Computers don't drive the computer industry.

People do.

And the features that matter most will always be the human ones.

Like ingenuity.

Commitment.

And determination.

That's why developing great people is every bit as important as developing great technology. With that goal in mind, we're establishing a New Leaders College Scholarship Program with an initial donation of \$250,000.

Now more than ever, it's important that all of us do what we can to help develop the future leaders of our industry.

After all, if we don't, who will?

**COMPUTER[®]
ASSOCIATES**
Software superior by design.

486, palmtops lead way at PC Expo

Product announcements, Compaq-sparked price cuts highlighted at recent conference

BY MICHAEL FITZGERALD
 (CW 1747)

NEW YORK — All-hours night life, harrowing tax rides and hot dogs: It was New York, all right. As if to prove it, Compaq PC Expo had more products than you could count. Some of them were even new.

There were also a variety of price cuts made, in response to Compaq Computer Corp.'s low-cost offerings (CW, June 22).

The largest vendor to add its name to the list of price cutters was NEC Technology, Inc. (Bosch, Mass.-based NEC cut prices on all of its products (see story page 39).

Epson America, Inc. added several new models to its product line. It added a variety of Extended Industry Standard Architecture-based desktop and tower

systems based on Intel Corp.'s 1486 processor and two XT/AT Bus-based boxes, the Equity 486DX/50 Plus and the Equity 386/33 Plus. Epson also extended its service hours and added on-site service. A company spokesman said Epson was debating how to price the system in the wake of the Compaq price cuts.

NCR Corp. added a multimedia machine. The product, called the System 3331 Multimedia Learning Station, is the first of a planned series of products that merge technology from AT/AT and NCR. It uses either the 25-MHz 486SX or the 33-MHz 486DX, is upgradeable and has built-in full-motion video, stereo sound and 1,024-by-768-pixel graphics resolution.

NCR said the product will cost \$5,300 when available next month. Neil Whittington, assistant vice president of NCR's multimedia products business unit, said automated teller machines in the future would likely have multimedia capabilities.

Chips and Technologies, Inc. landed some U.S. customers for its 80386 offering, ComputerLand Pro, will use its Tron store brand models, as will Hapagage Direct, a division of Hapagage Computer Works, Inc. in Hapagage, N.Y. Chips and Technologies also showed five palmtop-size personal computers in its booth that use its PC/Chip, including the HandBook from Gateway 2000 Ltd. by 10-in., 3.6-pinch chip that will cost \$1,295 and a small pen-based system from JFK Associates, Inc.

First on the block

Wyse Technology, Inc. related what it said was the first 5-pound notebook with a 200M-byte hard drive. The Wyse DecisionMate 486SLC Model 2004 uses Cyrix Corp.'s 25-MHz CA86SLC processor, has 4M bytes of random-access memory and will cost \$2,899 when it begins shipping later this month.

Memorex Telex Corp. rejoined the ranks of PC manufacturers, announcing nine new systems, the least expensive of which is a 25-MHz 386SX with 2M bytes of RAM for \$621.

Phoenix Technologies Ltd. and Calera

Recognition Systems, Inc. announced that they would build a combined fax/optical character recognition software product for sale to hardware manufacturers. The integrated product, slated for release by the end of the month, will combine PhoenixFax with Sunnyside, Calif.-based Calera's FaxBuilder. Phoenix Technologies, based in Newwood, Mass., also said it would create a retail line of communications software.

New York-based Hertz Computer Corp. brought out a 50-MHz 486-based box. The Hertz 486/50E has 8M bytes of RAM, 256K bytes of secondary cache and eight expansion slots. It is priced at \$2,149.

Overseas demand

Texas Micro, Inc. said it was shipping its fault-tolerant server, the FSTA, and that its first sales were in the Japanese market. Tokyo's city hall, which is piloting five of the new servers to process its emergency calls, plans to purchase 35 more if the pilot goes as planned.

Dauphin Technology, Inc. announced it would focus 90% of its research and development money on pen computing. Alan Yang, Dauphin's president and chief executive officer, said the company plans to announce five new pen-based systems by the end of the year.

Electronic Publishing Corp., a Haverford, Pa., company, demonstrated a prototype of its CityGuide product. Designed to be used on a portable computer, the CityGuide features Zagat's restaurant guides, landmarks and hotels, plus directions and other information for the 30 largest U.S. cities. It will cost \$69.95 per city when available late this month and requires a system with at least 2M bytes of RAM.

Integrated Technology, Inc., a start-up based in South Orange, N.J., displayed its CompuPhone telephone keyboard, which features a telephone built into a computer keyboard. The product is currently under license to Key Tronic Corp., a large maker of keyboards. The CompuPhone comes in either a headset or handset version.

The portable that fit in a purse

CONTINUED FROM PAGE 39

Pacific Bell piloted the Poqet, including a proprietary database Boyam built using Microsoft Corp.'s C 6.0, in 1991 and rolled out Poqets to half of its outside representatives — approximately 300 — in January.

The database contains pricing data for advertisements and information on co-op deals. Data is entered in a Borland International, Inc. Paradox format, run through an ASCII transfer program and put on random-access memory cards. Information from the proprietary database on the Poqets is then fed into a personal computer in each sales branch that has a card reader.

Data is ultimately transferred into an Oracle Corp. database on corporate Digital Equipment Corp. VAX systems.

Boyam said 40% of the sales reps who have Poqets use them heavily, and 75%

use them at least twice a week. Pacific Bell Directory is evaluating their impact now. Graham said an internal survey showed that 91% of the salespeople said they did their jobs better because of the Poqets.

Graham, now general manager of Pacific Bell Directory's San Jose, Calif., sales branch, said he was going to propose the purchase of more Poqets. Pacific Bell will invest cautiously, though, because it plans to continue looking at new uses of technology, including pen-capable systems. Graham and Boyam said pen technology presents possibilities for the company.

"I went to a construction site with one of the reps in talk to a plumber and we had to climb up to the sixth floor of this building. In an environment like that, two-handed computing would be nice," Boyam said.

Caere unveils fax/OCR software

BY CAROL HILDEBRAND
LIVESTART

Caere Corp. is taking optical character recognition (OCR) a step further with the introduction of FaxMaster.

The first example of integrated fax/OCR software aimed at Microsoft Corp.'s Windows, FaxMaster allows users to send and receive both text and compressed fax documents.

"Current fax software is a photo, an image — you can't edit it, and you also can't share it" because of the space such an image can take up, noted Larry Miller, Caere's vice president of marketing. "This is the first complete product that sends and receives in computer-readable form."

FaxMaster is based on some

of the following features:

- Send and receive. Users can send and receive faxes directly from within a desktop application. The package utilizes direct input technology to allow access between FaxMaster and their applications.

OCR is performed automatically in the background mode for faxes being received.

FaxMaster also enables users to receive both text and image versions of incoming faxes. The software is activated by clicking on the FaxMaster icon within an application.

• OCR. FaxMaster can recognize standard-mode faxes, which are sent at only 200 by 100 dot/in. The technology is built on a neural OCR engine in order to solve the low-resolution fax recognition issue.

• Compress. Proprietary technology from Caere allows users to compress images well beyond industry standards if the user is sending and receiving images. Standard-mode faxes can be compressed by up to 5:1 over CCITT Group III compression, which can significantly reduce storage problems.

Stated for third-quarter availability, FaxMaster is priced at \$249. The package requires a personal computer of the 386 class or above with 4M bytes of random-access memory, 8M bytes of available hard drive space and a mouse.

MS-DOS 3.1 or above and Microsoft Windows 3.1 are also necessary.

The software is compatible with Class 1, Class 2, CAS and Sierra SendFax modems.

terminal 50-pin SCSI-2 connector. Support is provided for hard disk drives with up to 8G bytes of data storage capacity and any combination of up to two 3½-in. or 5¼-in. drives, including support for the 2.8M-byte floppy disk drives.

The BT-5455 costs \$449.

Systems

Panacea, Inc. has announced a line of high-performance AutoCAD software accelerator products for Autodesk, Inc.'s AutoCAD Release 12.

TurboDLD Classic and TurboDLD Deluxe offer four times the increased speed of AutoCAD drivers in Zoom, Pan and Redraw operations. The TurboDLD Classic has "The Big Picture," a movable bird's eye view of the current AutoCAD drawing with the active editing area highlighted. TurboDLD Deluxe comes with real-time panning, a Zoom Preview applet, pop-up menus, a drawing viewer and fully reconfigurable digitizer buttons.

The TurboDLD Classic costs \$149, and the TurboDLD Deluxe costs \$249.

Systat, Inc. has announced Systat for Windows.

According to the company, Microsoft Corp.'s Windows environment makes it easier to learn Systat PC, and the point and

Windows printing fixes

Part of a series of Windows 3.1 user tips provided by Microsoft Corp. and based on questions commonly asked of Microsoft customer support personnel.

Q What could be causing printing problems that didn't occur in Windows Version 3.0?

When you set up Windows 3.1, some printer drivers may not get updated correctly. To make sure your printer driver was updated correctly, do the following:

- Remove the printer driver that you are using from your system. Run Control Panel and choose Printers. Select the printer driver and choose the Remove button.
- Use the File Manager to change to the WINDOWS/SYSTEM directory. Select the printer driver file name and press the Delete key.
- Reinstall the printer driver by running Control Panel and choosing Printers. Choose the Add button, select your printer and choose the Install button.

Q When I print in landscape mode on a Linotronic printer, the Encapsulated PostScript graphic portions of the document are rotated. Why?

A If you are using the Linotronic or another PostScript printer driver, try adding this line: — LandscapeOrient = 270 — to the (ModelName.Port) section of the WINNINI file. This is the section that says [Linotronic 200/230.LPT1], and not the section that says [PostScript.LPT1].

Q Can I use TrueType fonts with my Hewlett-Packard Co. DeskJet printer?

A The printer drivers supplied by HP do not support TrueType fonts. You can use the DeskJet printer driver that comes with Windows 3.1, but it does not support HP scalable fonts.

Q Is it possible to print in color using my HP DeskJet 500C printer?

A Using the printer driver supplied by HP, you can print in color using this printer. If you want to use TrueType fonts, you can use the printer driver that comes with Windows 3.1; however, you won't be able to print in color.

click interface speeds tasks, providing quick analyses. Data sets can be analyzed, and a selection of statistical analysis can be accessed and applied to data with QuickStat buttons.

Systat for Windows can be accessed to work in either standard or extended memory modes. This version offers new brushing tools that let users click on data points and examine corresponding cases in the data editor.

Systat for Windows costs \$895.

Document Technologies, Inc. has created the WDK2000, a Microsoft Corp. Windows developer's kit.

The product was designed to simplify Windows programs for displaying, scanning, processing, printing and storing computer images that have resolution and clarity similar to those printed or written on paper.

The WDK2000 can display images at 200 dot/in. and has imaging functions that are accessed using Dynamic Linked Libraries. More than 40 different high-level functions are offered, including image scan, image print and

image storage on local Small Computer Systems Interface or network devices, compression and expansion.

The WDK2000 costs \$1,495.

Data storage

Tandberg Data, Inc. has introduced the Panther 2000, a 14-in. cartridge tape backup system.

The Panther 2000 features a native storage capacity of 2G bytes, which can be doubled to more than 4G bytes with data compression.

The product is available in internal and external configurations for single-user and local-area network applications and is compatible with a variety of environments, including IBM Personal Computers and compatibles, Sun Microsystems, Inc. SPARCstations and Apple Computer, Inc. Macintoshes.

Further 2000 prices range from \$3,100 to \$5,600.

NEW PRODUCTS

Utilities

Demax Software, Inc. has announced the releases of the System Detective Automated Operations (AO) and Interactive Session modules. Both products assist a range of system elements for more control of the security environment.

They have the ability to monitor remote terminals and lock out users attempting to access systems via batch, network or detached jobs.

System Detective AO has an expanded set of utilities to query its event database. System Detective Interactive Session allows users to interact directly with a suspicious user or process and can be tailored to a company's requirements with a customizable command set.

Pricing for the System Detective AO module starts at \$295, and the Interactive Session module starts at \$245.

The DataTechnology Corp. has started shipping the DTC2290 32-bit integrated Drive Electronics (IDE) to Extended Industry Standard Architecture (EISA) host adapter.

The product is a controller that allows the IDE disk drives to perform at their maximum data rates of up to 8M byte/sec. on the EISA bus.

While under DOS, the DTC2290 typically improves EISA system data throughput by 300% to 400%, according to the company. The DTC2290 can support up to four IDE disk drives, each with an 8G-byte capacity, for a maximum capacity of 32G bytes per card.

EISA configuration file support is provided, and the DTC2290 can support both daisy-chaining and mirroring under Novell, Inc. NetWare with a single card.

The DTC2290 costs \$145.

MUCH FOR THE IDEA THAT TO LIMITED THINKING.

memory module option provide quantum leaps in performance. Without

unfamiliar dimension in mainstream business computing: your voice.

The result of a working collaboration between Compaq and Microsoft, it allows you, among other things, to easily paste voice messages into spreadsheets and documents. Either as notes to yourself or as voice-mail across your entire network.

And we've engineered this breadth of technology right onto the PC's system board, preserving the small footprint, large storage capacity and expansion of the COMPAQ DESKPRO/i.

Not to mention your financial integrity.

Add CompaqCare, our new service and support program with our free one-year, on-site* limited warranty. An Asset Management Provision that gives you and your network administrator a snapshot of your PC's configuration. And you have nothing short of a system that breaks a lot of new ground. Without breaking the bank.

For more detailed information, just call us at 1-800-345-1518, ext. 210 in the U.S., or call us at 1-800-263-5868, ext. 210 in Canada.

We bet you'll be as excited about the COMPAQ DESKPRO/i as we are.

Intel 386/25, 386/33, 486SX/25, 486/33 • QVision accelerated graphics • Chip upgradability • Integrated business audio • 4 MB RAM (expandable to 32 MB) • Cache memory standard • 2 ISA expansion slots • 3 drive bays • 84-MB to 510-MB hard drive options • Multi-level security features • Microsoft MS-DOS 5.0 as published by Compaq

In scrolling, window resizing and accessing menus, our new QVision accelerated graphics beat the competition by as much as 10 to 1.

You can paste voice messages into Microsoft Windows 3.1 business documents and spreadsheets with our integrated business audio system.

similar outlays of cash.

AN INEXPENSIVE PC THAT FROM THE COMPANY THAT

What happens when the best computer engineers in the world design a low-priced desktop PC? You get the new COMPAQ ProLinea Line of PCs, perhaps the best value PCs in the world. What happens when a clone maker designs a low-priced PC? You get what you pay for.

When Compaq engineers set out to build an affordable, full-performance desktop PC with all the essential features, there were many options to choose from. We could have bought

an existing low-end computer company.

We could have farmed out all the manufacturing.

We could have bought parts from the cheapest vendor in town.

But then all we would have ended up with is another inferior, low-priced

*The service is provided by contracted Service Providers and may not be available in certain geographic locations. Contact the Compaq Customer Support Center for further details. © 1993 Compaq Computer Corporation. All Rights Reserved. Printed in the U.S.A. COMPAQ, ProLinea and Compaq are trademarks of Compaq Computer Corporation.

IT'S AS GOOD AS A COMPAQ. WHAT YOU OUGHT TO KNOW.

clone. And what we were determined to build was a low-priced COMPAQ computer.

Which is what you told us you wanted.

So through some high levels of chip integration and some equally high levels of engineering, design

the virtues you've come to expect from Compaq.

You can choose from three different models, opting for either Intel 386SX/25 or 486/33 processing power.

So whether you're most concerned with expansion, storage, processing speed or a small footprint, you're bound to find a model perfectly suited to all of your needs.

And each comes with a high-resolution 1024 x 768 video system.

Most importantly, the new COMPAQ ProLinea PCs are backed not only by the assurance of the COMPAQ name, but by CompaqCare, our new

service and support program. Which includes a free, one-year, on-site* limited warranty, and a host of other services.

And to go along with this new line of PCs, there's a whole new line of places you can find them. Give us a call for more details.

In the U.S., call us at 1-800-345-1518, ext. 215, and in Canada, just call

1-800-263-5868, ext. 215.

We think you'll be pleasantly surprised at exactly how much the COMPAQ ProLinea PCs have to offer.

And equally surprised by how little we're able to offer them for.

All in all, the COMPAQ ProLinea 3/25 PC sizes up quite nicely. At a mere 12.6" x 14.9" x 3.5", it's one of the smallest footprints in the industry.

All of our models are backed by CompaqCare, our comprehensive new service and support program. For details, just call 1-800-345-1518.

Intel 386SX/25 • small footprint • 2 MB RAM • 2 ISA slots • 2 drive bays • 40- or 14-MB hard drive
Intel 386SX/25 • 2 MB RAM • 3 ISA slots • 3 drive bays • 24- or 120-MB hard drive
Intel 486/33 • 4 MB RAM • 3 ISA slots • 3 drive bays • 24- or 120-MB hard drive
All models include high-resolution 1024 x 768 video and pre-installed Microsoft MS-DOS 5.0 as published by Compaq

and just plain common sense, we've managed to cut costs in both system design and manufacturing.

While still managing to deliver 100 percent of

AICORP AND AION SIGN MERGER AGREEMENT

*Transaction cements market dominance of two leading knowledge base system vendors
and sets stage for entry into broader application development market*

On June 25, 1992, AICorp, Inc. and Aion Corporation, the two leading knowledge base system vendors, signed an agreement to merge operations. The merger establishes a single company with clear market dominance and sets the stage to extend our reach into the larger market for general purpose application development tools.

Our mission is to be the leading worldwide provider of application development software products and services that enable organizations to automate their business processes. With nearly 250 employees and an installed base of over 1,200 worldwide customers representing more than 10,000 software licenses, we have the talent and experience to help our customers compete more successfully in a challenging marketplace.

Our new company will continue to develop, sell and maintain a broad suite of product solutions, including our two industry-leading knowledge base system products, KBMS® and the Aion® Development System, as well as INTELLECT™, a natural language data access tool. By leveraging our combined technical skills and resources in object orientation, client/server environments, graphical user interfaces, data access and platform portability, we will provide our customers the application development tools and services required to build and sustain productive business applications.

The alliance between AICorp and Aion accelerates the rate of innovation and advancement of our product and service offerings, enabling us to more fully support the efficiency and profitability goals of our customers.

Novell envisions stratified market

BY MICHELE DOSTERT
SPECIAL TO CW

Novell, Inc.'s next-generation NetWare 4.0 product, slated to ship by year's end, will be aimed at the high-end, corporate-wide network market. The company said it hopes that adding a more robust network operating system product to its current NetWare line will help Novell sell into Fortune 1,000 local-area network sites without loosening its grip on the workgroup and departmental markets.

"NetWare 3.1 was our new, high-end technology when it was introduced, but that was two years ago," said Bob Young, director of marketing at Novell's NetWare Product Division.

"Now, we are positioning

NetWare Lite for the 25-user level and our 2.8 line at the workgroup, 100-user versions that represent a major push for us to get into the high end of the market," Young said.

Little user interest

Earlier, Novell had planned to call its forthcoming NetWare release NetWare 3.2 and position it as an extension of its 3.X line. However, Novell said it discovered that many 3.1 customers were not interested in the planned enhancements, such as directory and naming services, foreign language support, integrated image processing engine and SFT III fault tolerance.

Also, Novell's experimental alpha release of a 3.11-based

reportedly ran into problems with 3.X's 256-user limit dictated by its bindery structure.

"I looked at bringing in the 3.X-based 1,000-user NetWare but decided against it," said Brian Gunnell, assistant vice president of networks at Caneco, Inc., a Carmel, Ind.-based insurance holding company with a 600-node NetWare LAN. "The printing didn't work. We wanted to use it for mail, but it was limited by the 256-user bindery — there were just too many caveats for me."

"We built our 1,000-user version on NetWare 3.X, but we always intended to move it to a directory-based platform. It was our customers who suggested that such a major architecture dictated a next-generation prod-

uct name; hence, NetWare 4.0," Young said.

Some industry experts said they expect NetWare 4.0 to do well in the Fortune 1,000 market. "I talked to two customers today who are very interested in 1,000-user NetWare 4.0, and both want to use it as glue to help integrate their mainframe and minis with their LANs," said Pete Heles, vice president of LanTech, a high-end integrator in Indianapolis.

"Our customers with large LANs are very excited about the new directory-based NetWare," said Barry Saltzman, head of JWP, Inc.'s systems consulting group in New York.

"I think most of them will upgrade because the new directory services will let them manage their distributed LANs in all their branches from one central location, which is crucial for them."

Novell will try to lure large 3.X users to 4.0 by making the upgrade path as painless as possible: A "bindery emulator" in 4.0 will allow seamless integration of 3.X and 4.0 servers into one transparent network.

Slow to switch

But many 3.X users are approaching the upgrade cautiously. "We will look at 4.0 when it comes out, but I'm always leery of 4.0 releases," Gunnell said. "I'll definitely bring it up in test mode and run some benchmarks on it before I think about putting it into production."

Many users just getting comfortable with NetWare 3.11 said they are not inclined to upgrade anytime soon. "Sure, the im-

Lion's share

The lower end NetWare 2.0 line dominates the Novell install base, although Novell sees room for a NetWare version aimed higher than NetWare 3.0

Percent of installed base
Total: 1.5 million servers
(Quarter-end 1991)

Source: The Novell Group

proved directory and naming structure would be nice, but it's not enough to get me to move," said Bob Wraga, a network administrator at Deere & Co. in Moline, Ill. "Really, we're still getting our feet wet with 3.11. Now, if 4.0 would let me run my applications in protected mode, that would make me move."

Although Novell has not confirmed it, high-end resellers and applications developers who have seen preliminary demonstrations of 4.0 indicate that it will enable users to run in protected mode.

Barry Gilbert, director of the market research firm InfoCorp in Acton, Mass., said, "NetWare 4.0 won't be released till the end of the year, so we won't know until probably the first quarter of '93 how many users will move to 4.0, and how fast. It's going to be interesting to see how many customers really want 1,000-user NetWare."

Dostert is a Salt Lake City-based freelance writer.

PeopleSoft offers electronic support

BY ROSEMARY HAMILTON
CW STAFF

Two users of PeopleSoft, Inc.'s recently released electronic customer support system said it is a big step up from the traditional service methods.

PeopleSoft's PS/Forum is based on Lotus Development Corp.'s Notes workgroup software. The human resources software company purchased 250 copies of Notes from Lotus and is providing them to customers as part of their standard maintenance deal. With Notes, customers can access three databases at PeopleSoft, including one that contains updates and

fixes for the software.

"As far as providing access, there's no substitute," said Dick Schell, director of information systems at The Turner Corp. in New York. "There's no waiting for phone calls. We can just contact them any time we want to."

Customers can also access a database that serves as a user forum or bulletin board for PeopleSoft users to exchange information. Another database is for general discussion purposes.

At your service

Schell said PS/Forum allows him to directly correspond to PeopleSoft and, if an issue requires more in-depth discussion, a

meeting can be arranged. At the same time, if a product concern is minor, a user can find information in one of the databases and not have to wait for a company response.

"There's more efficient communication," added David Weitzer, manager of human resources systems and records at Reim, a Siemens company. "You can type out a lengthy message to (PeopleSoft support), and it allows them to know in detail what it is you need to know. Then they have time to formulate their response."

PeopleSoft uses Notes internally and has been planning to extend it to its customer base.

Work flow emerges as imaging trend

Importance soars as imaging technology evolves into catalyst for business process re-engineering

BY ELLIS BOOKER
CIVILIAN

ANAHEIM, Calif. — Work flow was highlighted as the crucial software component of imaging systems during last month's Association for Image and Information Management (AIIM) conference here.

On the hardware side, meanwhile, there was a plethora of personal, computer, local-area network-based imaging systems. There was also a gathering of support for Unix-based servers in general — particularly the IBM RISC System/6000. Why has work flow, which manages the routing of images between individuals, applications and processes, become such an important software category?

As imaging has evolved from a mandate "storage and retrieval" technology to a leading catalyst for business process re-engineering, work flow has become the apparatus for this broader activity.

On the brink

Indeed, re-engineering was on the minds of many attendees, according to a straw poll conducted by IBM at the show. Among other results, the survey found that 76% of the 377 respondents are implementing or plan to implement a business re-engineering project; approximately 70% said this activity was "likely" to take

place within a year.

Virtually all imaging vendors now offer work flow, either of their own design or based on another vendor's core technology.

For instance, Digital Equipment Corp. picked EPIC/work flow from Computon Technologies Corp. in Rutherford, N.J., as a work-flow component for its VAX/VMS DECimage Express product.

The industry trend, apparent at AIIM, is for the work-flow component, like the image system, to run under an icon-driven graphical user interface (GUI). For the majority of vendors, this means Microsoft Corp.'s Windows environment.

In addition, the capabilities of work-flow systems continue to improve. Sigma Systems, Inc., for instance, announced at AIIM a new version of its Route-Builder graphical work-flow development product that supports parallel routing, time and event queues and the creation of ad hoc work-flow instructions.

Indeed, while work-flow systems are still primarily targeted at information systems departments or systems integrators, the move toward object-oriented graphical interfaces promises to make them easy enough for end users to program.

In its AIIM booth, for instance,

IBM demonstrated a prototype object-oriented system that builds host-based work-flow instructions from an OS/2 2.0 workstation.

Giant leap

Show attendees said ease of use and end-user access to imaging could take a quantum step forward when Lotus Development Corp.'s Notes: Document Imaging, a \$200 to \$400 companion product to Lotus' Notes, hits the streets within the next two months.

But under a partnership between Lotus and Eastman Kodak Co., Calera Information Systems, Inc. and GammaLink, the product could have a profound effect on the imaging industry, according to analysts.

"The total world of imaging is 50,000 to 60,000 seats, so if the image version of Notes gets 10% of, say, a half-million Notes sites, it'll double the size of the industry," said analyst Bruce R. Silver at BIS Strategic Decisions in Norwell, Mass.

"But Notes isn't going to do much processing at Blue Shield," warned Silver, adding that transaction-intensive, production-oriented imaging products from vendors such as FileNet Corp. would still find a large audience.

Noting the impact that work flow could have on their business operations, several sophisticated users of imaging technology at AIIM indicated a need to "develop" the work-flow system from the imaging system.

"The work flow we want is one that works independently of the imaging system," said Gamil Sikla, assistant vice president at The First National Bank of Chicago.

No easy task

"Architecturally it's there, it's possible, but it's not simple," Silver observed, adding that this might be one direction for the marketplace in the coming year.

But if work-flow systems do become interoperable, imaging systems from different vendors will be able to work together transparently.

That scenario suggests partnerships between vendors offering high-end, transaction-oriented imaging solutions — the kinds of products designed to automate insurance claims processing — and single-user or workgroup imaging systems that typically support more ad hoc, white-collar applications.

Products issuing from these relationships could span several applications and production-oriented applications.

"The first vendor to provide that," said Jordan M. Lubit, vice president of marketing at FileNet, "is likely to have a winner."

Citicorp Credit is also writing other applications, including a cash management system, with which the Skylight software will communicate. The general ledger will be operational by late this month, Weissensee said, and will support up to four users.

The Skylight software is replacing a PC package called Soloman. "We found the current package to be inflexible," said Tom Adamski, director of card products (treasury systems). "RFS/GL had the best grip on multicurrency," an important requirement because Citicorp does business in so many different countries, Adamski said.

Another criterion was that the package had to work with Sybase, Inc.'s relational database under Unix, since that is Citicorp Credit's standard. Not quite three years ago, Citicorp Credit switched over from a proprietary Hewlett-Packard Co. Series 3000 minicomputer to the Sun workstations. "We wanted the price/performance and scalability of the client/server architecture," a package said. "And development is much easier on the Sun than it was on either a miniframe or a microcomputer."

Citicorp Credit draws ledger into Sun net

BY JOHANNIA AMBROSIO
CIVILIAN

Citicorp Credit Services' financial reporting group is adding to the suite of commercial applications on its network of Sun Microsystems, Inc. workstations.

Most recently, the Citicorp subsidiary chose a general ledger package. This package joins software from Lotus Development Corp. and Island Graphics Corp., among others, that runs on Citicorp Credit's 50-workstation Sun network. The Long Island City, N.Y.-based company uses SPARC-1 and SPARC-2 workstations, three Sun servers and 20 personal computers, including Compaq Computer Corp. and Dell Computer Corp. machines.

The general ledger system, called RFS/GL from Skylight Systems in Wyncote, Pa., will initially be used to track Citicorp

Credit's asset securitization, which involves turning \$23 billion worth of credit-card receivables into secured bonds.

"Eventually we will use

THE GENERAL ledger system will initially be used to track Citicorp Credit's asset securitization.

RFS/GL as a subledger with the corporate Citicorp general ledger system," said John Weissensee, vice president of treasury operations at Citicorp Credit. The corporate general ledger is a package from McCormack & Dodge, now part of Dun & Bradstreet Software, that runs on an IBM mainframe.

NEW PRODUCTS

LAN hardware

Asante Technologies, Inc. has introduced a series of Token Ring adapter cards.

TokenPac cards are designed for personal computers and compatibles based on National Semiconductor Corp.'s Token Ring Protocol Interface Controller. The cards connect PCs based on Extended Industry Standard Architecture and IBM's Micro Channel Architecture to IEEE 802.5 Token Ring networks and provide 4/16M bit/sec. performance.

The TokenPac network interface cards cost \$699. Asante Technologies

IN BRIEF

Xerox joins Intergraph

■ Intergraph Corp. and Xerox Imaging Systems (XIS) recently formed a business alliance to provide Intergraph customers with text recognition software. Under the agreement, Intergraph will integrate XIS' Scan-Worx, a document input system for Unix platforms, into its reduced instruction set computing-based workstation line for document image management and publishing systems.

One major customer of the combined Intergraph/XIS product is the U.S. Naval Sea Systems Command, which last year awarded Intergraph a \$362 million contract for computer-aided design work.

DOD funds three-year study on LAN/WAN ATM link coordination

BY ELISABETH HORWITT
CW STAFF

A consortium of vendor, academic and government organizations recently embarked on a three-year test of asynchronous transfer mode (ATM) technology under heavy application loads. A major focus of the Multi-dimensional Applications and Gigabit Internetwork Consortium is to study how to effectively coordinate links between local- and wide-area ATM devices, consortium members said.

Funded by the U.S. Department of Defense (DOD), the project will run a bandwidth-hungry dynamic terrain visualization application across an ATM-based network. The application will use the ATM network to provide several geographically separate data centers with terrain visualization data collected by the Earth Resources Observation Systems Data Center, a Sioux Falls, S.D. based unit of the U.S. Geological Survey's National Mapping Division.

The data will end up at the Army's Future Battle Laboratory in Fort Leavenworth, Kan., where military personnel will be able to view terrain on a computer screen as if they were traveling over it by foot, air or car.

Also linked via the ATM network will be the Minnesota Super Computer Center, Inc. in Minneapolis and the University of Kansas in Lawrence, Kan. U.S. Sprint Communications Co. will interconnect the various sites over 2.4G bit/sec. ATM links that are based on the Synchronous Optical Network (SONET) standard, spokesmen said.

All-purpose project

The project was designed to serve several purposes for the consortium members. Of major potential use to future ATM network users is the work being done by Digital Equipment Corp., Sprint, Northern Telecom, Inc. and the University of Kansas to "explore the feasibility of some options for interfacing the LAN and WAN ATM," said Gary Minden, an associate professor of electrical and computer engineering at the University of Kansas. Among the issues to be explored during the project are the following:

- What protocols the ATM local-

area network switch should use to set up circuits over a long-distance ATM network. "The local ATM group is talking about setting up the initial circuits via a Simple Network Management Protocol mechanism, but that probably won't fly on the WAN," Minden said.

- How to manage allocation of long-distance ATM bandwidth among different devices to avoid congestion.

- How serious is the risk that occasional cells, or small packets, will be dropped during transmission, and how this risk can be minimized.

MILITARY PERSONNEL will be able to view terrain on a computer screen as if they were actually traveling over it by foot, air or car.

In general, the vendors will be testing interoperability and performance of ATM links that include both a LAN and WAN network component. The university will be testing a gateway that it is developing between ATM-based LANs and WAN services, he added. An experimental ATM LAN switch from DEC will be using the gateway to gain access to Sprint's ATM-based long-distance connections.

DOD expects to test a potentially useful application for the military and also collect some valuable data about high-speed networks that will be useful to government high-speed network projects such as the National Research and Education Network.

"This is one of several gigabit-per-second, test-bed networks that DARPA is working on," a Sprint spokesman said.

Sprint hopes to gain insight into troubleshooting, management and interoperability issues associated with operating a high-speed network, the spokesman added. Sprint also plans to introduce a service based on broadband Integrated Services Digital Network, which will incorporate both ATM and SONET, in the mid-1990s, he added.

Hiding migration from users

X is one aid for firms in systems transition

BY JOANIE M. WEXLER
CW STAFF

Many information services professionals migrating their companies from host-centric to distributed computing schemes are facing a juggling act as they maintain large legacy systems while porting corporate applications to smaller, dispersed platforms.

This challenge is generally being met by creating desktop "windows" into the corporate network through either home-grown or industry-standard interfaces such as the X Window System.

Both tactics mask users from the application porting that is going on behind the scenes.

Users, then, transparently access data from wherever it happens to reside at the moment across the network without necessarily knowing where they are getting it from.

Protection preparation

The approach is an example of one migration method advocated by Judith Hurwitz, president of Hurwitz Consulting Group in Newton, Mass. That strategy

consists of "surrounding" applications while they are ported to new platforms. While heavy-duty application re-engineering takes place on the back-end computer engines, users continue to see a consistent interface, and the desktop hardware investment is protected, Hurwitz explained.

For example, companies such as Euron Gas Services Corp. in Houston and Citicorp's Global Cash Management Services Group in Tampa, Fla., are building separate front ends for each of the various desktop platforms installed throughout their organizations. This scenario can require multiple communications protocol stacks on each desktop

in order to allow the user to tap into the various disparate hosts, explained Jim Queen, local-area network manager at Euron.

"Users get a screenful of data that could easily be a composite from several different platforms" across the network, Queen said. Euron is using PowerSoft Corp.'s PowerBuilder, an SQL development tool, to develop a Microsoft Corp. Windows application for accessing far-flung data.

On other desktops, the company is running an OS/2 application with Novell, Inc. NetWare Requester, IBM Systems Network Architecture and Unix-oriented Transmission Control

Re-engineering report cards

To help bring their software re-engineering projects in on time and within budget, some organizations have looked to the Software Process Program at the Carnegie Engineering Institute (SEI) at Carnegie Mellon University in Pittsburgh.

The program is a review process that helps organizations evaluate and implement project planning, testing, standards implementation, configuration management and quality assurance procedures in their software development efforts. One commercial site leveraging the program is Citicorp, which began the process last summer. As part of its global effort to reduce network and systems redundancies throughout the corporation, Citicorp is turning to open, distributed computing based on the Open Software Foundation's Distributed Computing Environment, explained Richard Lessard, senior vice president of applications development in the Global Cash Management Services division.

For its software development efforts, which include shifting applications from a mainframe-centric to distributed scenario, Citicorp received a "strong 2" from Carnegie Mellon on a 1-to-5 scale, with 5 reflecting the most mature development category, Lessard said.

Bill Curtis, director of the Carnegie Mellon program, explained that 80% of the SEI organiza-

tions assessed so far have received a 1 rating, which indicates an organization with "really no defined process that is crisis-driven and has lots of defects." Only 2% to 3% received a 4; no organizations received a 5. Carnegie Mellon is planning to issue a report on its findings with the 50 companies later this year, Curtis said.

Organizations moving to distributed computing are finding that they don't have a life-cycle process in place, such as version control, noted Paul Scheib, senior managing consultant at Arthur D. Little, Inc. in Burlington, Mass. His firm is one of nine independent consulting firms licensed by Carnegie Mellon to conduct the process evaluations. "A lot of the controls of the mainframe environment just go away when you distribute," he added.

Lessard said the study told Citicorp that in order to advance to a 3 rating, it must either buy or build LAN-based tools that allow the firm to integrate the modeling and estimating efforts of similar, individual projects and build in appropriate changeback and better "what if" mechanisms.

Users have cited a lack of tools as a major hurdle in moving to distributed computing. However, Lessard noted, "tools are secondary. If you can't manage the development process" from an organizational perspective, "there is no point."

DANIE M. WEXLER

Router delivery lag concerns users

BY JOANIE M. WEXLER
CW STAFF

Despite user excitement about plans by the two fastest growing multiprotocol router vendors to build industry-standard switches for multimedia applications [CW, June 29], several companies pointed to some housekeeping issues they would like to see their suppliers clear up first.

For example, delivery of Wellfleet Communications, Inc.'s gigabit-backplane Backbone Node bridge/router — with versions originally slated to ship during this and second quarters of this year — has slipped by about a quarter. While shipment is "imminent," according to Wellfleet President Paul Severino, the lower-end Link Backbone Node, due to ship first, will route only Digital Equipment Corp. DECnet Phase IV and Transmission Control Protocol/Internet Protocol (IP) alongside translation and transparent bridging.

Wellfleet is not violating any promises with the limited support, but adding just the two protocols "doesn't do it for us because [Novell, Inc.'s] IPX is one of our biggest protocols," said Vincent G. Caratolo, vice president of distribution systems services at Wellfleet shop Merril Lynch & Co. in New York.

Similarly, "We're waiting for the [highest end] Backbone Concentrator Node for its redundancy level here at the data center," said John Scoggin, supervisor of network operations at Delmarva Power & Light Co., a Wellfleet

customer in Newark, Del. On the protocol support side, Delmarva is tapping its foot for Wellfleet's promised Banyan Systems, Inc. Vines IP support, Scoggin said. Wellfleet shop Bear, Stearns & Co. has been "telling Wellfleet since the beginning of the year to develop an HSSI," or High-Speed Serial Interface, said Ken

"The fault tolerance we need, particularly when we add our IBM SAN traffic to our router network, can't be found anywhere today except at Wellfleet," said Anthony Brown, manager of communications product development at Martin Marietta Information Systems Co. in Orlando, Fla. Martin Mari-

bringing down the network] will be architecturally difficult for Cisco. They'll probably need to build a new box to do it," Brown predicted.

Cisco President John P. Murtagh said his firm "is always looking at changing architectures" but must be careful not to displace its installed base. He acknowledged that it would be "highly unlikely" that a new hardware architecture based on a different bus would be compatible with existing Cisco equipment.

Murtagh said Cisco recognizes the importance to customers of hot swappability, but he declined to say when the firm might provide that capability.

Hot tech

This issue is important to large Cisco shop Young & Rubicam, Inc., based in New York. "I haven't had any trouble with Cisco, but this issue makes me nervous because of our heavy reliance on these nodes," said Howard Maynard, senior vice president and director of MIS.

Frank Dausbeck, president of Communications Network Architects, Inc., a Washington, D.C., consultancy, insisted, "Cisco has got to come out with an interim architecture between what it currently has and its [Asynchronous Transfer Mode] switch, or Wellfleet will gain all the market share at the high end."

Rich Malone, a principal at Vertical Systems Group, a consulting firm in Dedham, Mass., agreed. "In the next generation, Cisco must be concerned with their hardware platform. If you run out of capacity, there's not much that interface software can do," he said.

Router rival race-off

Cisco's two-year jump on Wellfleet has rendered its presence significantly more pervasive, although analysts say the two firms are narrowing each and each today in closing sales

CW Chart: Michael Segares

Starkley, associate director of communications at the New York-based firm. He said that in the interim, he has installed a few routers from rival Cisco Systems, Inc. to support HSSI for some specific applications.

However, the industry also has issues with Cisco about the life cycle of its C-bus-based hardware architecture, which relies on shared memory and CPU power that render it less scalable as networks grow.

etta is currently preparing to issue a router bid.

The ability to isolate failures to protect network segments is inherent in Wellfleet's forthcoming Backbone Node design, which dedicates CPU power and memory to each set of network interface cards rather than having multiple router elements contend for shared resources.

"Redundant CPU and hot swappability [being able to add or remove interface cards without

Protocol may save IBM's 6611 processor

BY JOANIE M. WEXLER
CW STAFF

Ironically, it may be the open systems movement that saves IBM's neck in the multiprotocol router market.

Analysts point out that the proliferation of the industry-standard Open Shortest Path First (OSPF) routing protocol could reserve some space for IBM's 6611 Network Processor in existing internetworks.

IBM recently announced it will ship the 6611 three months late to ensure effective integration of myriad routing, bridging and management functions rather than shipping a product that might not meet user expectations [CW, June 29].

OSPF is a standard way for routers in Transmission Control Protocol/Internet Protocol networks to communicate routing table information, thus allowing routers from different vendors supporting the protocol to work together in one network. To

date, organizations have tended to stick with one router vendor because of interoperability concerns.

With router leaders such as Cisco Systems, Inc. and Wellfleet Communications, Inc. growing at spectacularly rapid rates and stockpiling market share, the interoperability afforded by OSPF could allow users to wait to install IBM routers in network niches where they deem it strategic, while moving ahead now with their base internetworking strategies.

"If OSPF proves to be a satisfactory mechanism for creating multivendor router networks, IBM will hold its own in the router market," predicted Frank Dausbeck, president of Communications Network Architects, Inc., a Washington, D.C., consultancy.

Forum formed

To that end, a group of router vendors, including Wellfleet, Protolite, Inc. and 3Com Corp.,

recently formed the OSPF Interoperability Forum to ensure that their routers mesh smoothly across networks.

"When OSPF kicks in, it will give us some alternatives," said Howard Maynard, senior vice president and director of MIS at worldwide advertising agency Young & Rubicam, Inc., a large Cisco shop based in New York. "But right now, a mixed bag [of routers] would only make my life more complicated."

While most users said they want the security of vendor independence, many may nonetheless elect not to exercise their options unless there are specific segments of their networks that merit a deviation from the corporate standard either by function or cost.

"Ideally, we'd like to standardize on one vendor and simply avoid dealing with the OSPF issues," said the vice president of telecommunications at a global bank who preferred not to be named.

Hiding migration woes

CONTINUED FROM PAGE 51

Protocol/Internet stacks for accessing different host environments, he said.

Similarly, Richard Howard, Citicorp Global Cash Management Services senior vice president of applications development, explained that his firm is using a homegrown front-end while "going into the tough back end and build, say, one investment system for everyone."

However, other large companies such as Kash & Karry Food Stores and The World Bank are achieving the same effect by using X display terminals, which support industry-standard graphical user interfaces, and the networkwide use of the X protocol.

X terminals are graphics-oriented hardware/software de-

IN BRIEF TX3 hub enhanced

Ascom Timeplex announced that it has enhanced its TX3/Super Hub System to support additional high-speed capabilities. The hub's Multi-megabit Data Transport Capability is said to support High-Speed Serial interface, V.35 and RS-530 connections at rates of 1.54M to 41M bit/sec. The hub can also dynamically set up multiple T1 channels that can be bundled into a single high-speed link. The enhancements are scheduled for October availability at prices of \$7,200 to \$12,000.

BT Tymnet, Inc. has signed two major video-conferencing customers. Unilever, a \$40 billion international consumer goods company, has decided to standardize on BT's technology and products for inter- and intracompany video communications. Unilever firm Lever Brothers Co. plans to use BT's service and equipment at its headquarters in London, Rotterdam, Netherlands, and in several U.S. locations.

Collegiate Telecommunications Association, a consortium of 50 colleges and universities, has selected BT's video-conferencing system as the basis for interactive, video-based courses.

which allow users to pull up multiple application windows on their screen from disparate networked hosts. Rather than running applications on the desktop that might have, to change, they open up desktop windows to the applications instead, explained Dennis W. Read, information engineer at Kash & Karry.

Use of X terminals also eliminates the need to run multiple protocol stacks on the desktop, observers said.

"In our organization, any technology we use must be scalable so we can incrementally add users with the right granularity," said Larry Austin, senior systems specialist at The World Bank in Washington, D.C. "X terminals are graphics-oriented hardware/software de-

LARGE SYSTEMS

HARDWARE • SOFTWARE • STRATEGIES

Open or closed? You decide

Users split on picking proprietary or independent relational databases

ANALYSIS

BY JEAN S. BOZMAN
CSTAFF

Picking a relational database is a weighty decision. Features, functions, performance and price all go into the selection process. But users still seem divided over whether to buy a database from their systems vendor or one from an independent supplier that runs on many hardware platforms.

Relational database management system software sales are split between proprietary and independent databases, according to surveys conducted by International Data Corp. (IDC) in Fram-

ingham, Mass. Independent RDBMS sales in 1991 totaled \$1.9 billion in the U.S. Roughly \$1.8 billion in U.S. sales that year were by systems vendors such as IBM, Digital Equipment Corp. and Hewlett-Packard Co., said Tony Picardi, director of software research at IDC.

The trade-offs between choosing "open" or "closed" systems are many, users said. Some said proprietary systems can be tuned better to their HP, DEC or IBM machines, providing better performance. But others said it is more important to have database products and tools that can be moved to other hard-

ware platforms, providing more flexibility in future information system planning.

Kenny Services, Inc., a New York division of Standard & Poor's Corp., is migrating from DEC VAXs to faster Sequent Computer Corp. Model 750s by moving its Oracle Corp. RDBMS to new hardware. "We didn't feel it was cost-effective to run Oracle on the VAXs anymore," said Ira Kirschner, director of technical services at Kenny Services. "Our incremental growth required us to do box swaps to get more power, and each box swap cost about \$200,000."

But longtime DEC and HP computer users, who feel no

Open and growing
Growth in the U.S. DBMS market is averaging 21% per year

Source: International Data Corp.

need to mix and match computer systems, said they benefit by getting database and systems support from the same vendor. And all major RDBMS vendors offer similar features for distributed database applications. "The classic trade-off is between flexibility and power," said Neil Hill, a senior analyst at Forester Research, Inc. in Cambridge, Mass. "The systems vendor can tune the database to the operating system, and they can devote more of the code in the database to optimizing performance for their platform."

"There are still some performance advantages to using a systems vendor's database," said Richard Kralowicz, vice president and chief information officer at PacificCare Health Systems, Inc., a health maintenance organization in Cypress, Calif. "Five years ago, it made lots of difference compared to the performance of an independent database. Today, the difference is in the 10% to 30% range."

Kralowicz, who uses Rdb 4.0 on a DEC VAX 9000 Model 400 as his primary production machine, sees another advantage:

synchronization of releases. When PacificCare upgrades to DEC's VMS 5.5 later this month, it will know that Rdb was changed to take advantage of the new VMS features. "When you're dealing with open software, the database might be ported to an HP platform first, rather than to DEC," he said.

Both DEC and HP give users powerful financial incentives to stay with their proprietary Rdb

WHEN USERS OF independent RDBMS packages do choose open platforms over proprietary systems, cost savings from cheaper hardware is often cited as the rationale.

and Allbase/SQL databases, respectively. A runtime version of Rdb has been provided at no cost for several years—and HP offers its Allbase at a steep discount compared with open system RDBMS products.

Support for a wide range of platforms sometimes strains independent vendors' resources.

DB2 tool aids remote databases

BY THOMAS HOFFMAN
CSTAFF

HOUSTON — Database users know that installing IBM DB2 on all machines that need to access DB2 data can get pretty expensive, with DB2 licenses costing more than \$3,000 per month. However, DB2 users may find solace in a new software tool aimed at allowing DB2 applications to exist where DB2 machines do not.

The new product, Shadow for DB2, which was introduced last month by Neon Systems, Inc., eases remote use of DB2 databases while reducing the need to replicate data. Peter Schaeffer, director of technology at Neon, said Shadow for DB2 replicates data residing on DB2 machines operating under IBM's MVS/XA or other releases of MVS.

Schaeffer said IBM has a system called Distributed Data Fa-

cility (DDF) that allows DB2 systems to communicate with one another. However, DDF requires users to conduct a number of administrative actions to request information from remote locations, according to Schaeffer.

Zero effort

For example, with DDF, DB2 users must change programs in order to access remote data. No such requirements apply to Shadow for DB2, which has pleased at least one early user.

"The administrative effort of Shadow for DB2 vs. DDF is zippo," said Robert Ippig, a senior consulting engineer at Texaco, Inc., which has been testing Shadow for DB2 for six weeks for its time-sharing option application.

Texaco is testing Shadow for DB2 at two data centers in Tulsa, Okla., and Ippig said he is

pleased with the results thus far. He cited resource savings and reduced overhead because Texaco no longer needs to replicate data for each of its DB2 machines. Ippig said his company will eventually install the software tool in Texaco's Bellaire, Texas, data center so all three data centers can be linked.

Schaeffer said his company is developing a mechanism for Sybase, Inc.'s SQL Server applications to access DB2, with plans to begin shipping a product within two months. Schaeffer said a similar product, called Shadow for IMS, would comprise personal computer or workstation-to-mainframe connectivity. He said Shadow for IMS will start shipping by September.

Shadow for DB2 is priced from \$9,950 to \$55,000, depending on the user's hardware platform, with multiple copy discounts available.

BIM ASSOCIATES, INC.
612-933-2885
FAX 612-933-7764

PROBLEM: Report management and distribution SOLUTION: BIM-QCOPY - complete report management

BIM-QCOPY is a BATCH utility that transfers, archives, combines, reformat, resequences and resequences reports from any combination of POWER SPool Queue, POWER PROFILE, VMSP Spool Queue, BIM-QCOPY Archive datasets or BIM-ARCHIVE's VSAM Archive Dataset. The output from BIM-QCOPY can be directed to any combination of BIM-QCOPY Archive datasets, BIM-ARCHIVE's VSAM Archive Dataset, Microfiche tapes or POWER LIST or PULN Queue.

BIM-QCOPY works on reports currently being produced so there is no need to change existing programs. BIM-QCOPY provides multiple selection criteria to resequence and resequence reports in almost any number of ways. One or multiple input reports may be combined concurrently into one or multiple output reports using over 30 selection and output criteria.

Full documentation or free 30-day trial available.

Price: \$3000, \$1500/yr., or \$150/mo.

BIM has over 40 years of software products for improving productivity and use of DCS/VS, OS/VS, and DCS and also provides training and consulting services.

AT&T 800 Services Advanced Features. Now more businesses can afford to do more with their 800 Service for less than ever before.

Doing more for less—it's what you want, what you need. AT&T answers the call with 800 Services Advanced Features at new, restructured prices. Now you have a choice; either our current flat monthly rate, or our new call-by-call rate of 5 cents per call. So AT&T 800 Services Advanced Features are affordable for virtually any size business.

- AT&T 800 Area Code Routing, Exchange Routing or Country Code Routing.

You can route calls based on originating area code, exchange or country code. Calls can go anywhere you need them to—the closest call center or a specific group within one location.

- AT&T 800 Day Manager and Time Manager.

You can route calls based on the day

of the week and time of day. During off-peak hours you can keep just one telemarketing center open and route all calls there.

- AT&T 800 Call Allocator.

Lets you specify the percentage of calls routed to two or more answering locations. This helps eliminate overloaded centers, blocked calls, or idle agents.

- AT&T's 800 Services Advanced Features can be combined any way you want at a cost of only 5 cents per call plus usage.*
• Improve productivity and profitability by handling calls faster and lowering your staffing costs.

All of these features are designed to help you serve your customers better. To learn more about our 800 Services Advanced Features, call your AT&T Account Executive or 1 800 247-1212, Ext. 431.

AT&T
The right choice.

DEC moves cause rumbles in third-party storage market

BY MELINDA CAROL BALLOU
COWLEY

Digital Equipment Corp.'s aggressive stance in the third-party DEC storage market is causing some concern among users at VAX sites about whether they will continue to have access to a range of competitive options.

Meanwhile, the recent sale of Santa Mesa, Calif.-based Emulex Corp.'s DEC storage line of products to System Industries, Inc. led users to question whether Emulex's shift in focus may become a wider trend.

DEC's lawsuits over its Standard Disk Interconnect (SDI) and Standard Tape Interconnect (STI) patents, together with a shrinking market, combined to influence Emulex's decision (CW, June 29).

"DEC is making it difficult for companies to survive. Look at Emulex," said Kent Gaudier, director of the computational lab-

oratory at Crump Institute for Biological Imaging at the University of California, Los Angeles. "DEC has a certain right of return on its investment. But the third-party market made DEC what it is because people were able to put their [DEC] systems together inexpensively [via third-party products]. DEC doesn't have a right to force them out of business."

Users singled out DEC's lawsuits as particularly worrisome. They favor a licensing strategy like the one DEC is now offering for the company's Digital Storage System Interconnect (DSSI) technology. Industry analysts and some third-party vendors said that policy is not prohibitive in its pricing structures.

According to some analysts, DEC was to some extent driven

into offering this licensing program by pressure from large DEC sites with third-party DSSI products and with whom DEC did not desire to jeopardize business.

A number of third-party vendors, including System Industries and Emulex, signed letters of accord with DEC to phase out sales of their SDI/STI products.

Vendors who continue to have lawsuits pending include MicroTechnologies, Inc. (MTI) in Anaheim, Calif., and Lago Systems, Inc. in Los Gatos, Calif.

"DEC is using the patents for marketing purposes and is trying to restrain trade," said Larry Pyle, president of Lago. DEC officials said, however, they are merely defending the company's rights. "Patents al-

low innovators the right to exclude others from making, using or selling the patented device," said John Gunther, DEC's legal counsel for mass storage. "In the case of the SDI and STI technology, we are merely asking for those rights guaranteed us by the U.S. Constitution."

On the other hand, users emphasized the importance of third-party alternatives. "It is a bit of a concern—I would hate to have DEC be my only option," Gardner said. "A smaller company can bring new technology out sooner and at a lower cost."

Tom Stewart, VAX systems manager at Information Handling Services, an information company in Englewood, Colo., recently purchased a FujiSei redundant arrays of inexpensive disks (RAID) box from MTI.

"Until recently, we always purchased from DEC," Stewart said. "We used VAX striping to get performance, but we really didn't look at some other alternatives. DEC is working on RAID technology, but we needed a product that was ready. Obviously, if you can only buy from one vendor, there also are not many choices on what you are going to pay."

Joseph Mohen recently said his company was engaged in discussions with at least two mainframe software vendors who would sell Software Meter as OEMs.

Computer Associates International, Inc. said it had limited communications with Prologist that eventually broke off. Sanjay Kumar, senior vice president of planning at CA, said his firm is not interested in buying Software Meter because CA engineers have been working on developing similar products. Kumar would not elaborate on CA's development activities.

Usage-based pricing gets boost

BY THOMAS HOFFMAN
COWLEY

UNIONDALE, N.Y. — The issue of tiered pricing vs. usage-based pricing for software is drawing attention with the introduction of a software utility designed to help mainframe software vendors track how often their products are used.

Prologist Corp., a developer of connectivity software for IBM host systems, recently announced Software Meter for use with IBM's MVS/ESA operating environment (CW, June 8).

Many users have said they would welcome a change from the current tiered-pricing model to a usage-based model. Some users expressed concern over paying high licensing fees for software that is used only a few times per year or priced based on the size of the CPU of the machine that runs it.

Endless possibilities

"Usage-based pricing has tremendous merit in certain types of products, especially with products in which the size of the CPU does not correlate with the application which is used," said Tom Lauer, vice president of computers and communications at Alamo Rent-A-Car, Inc. in Fort Lauderdale, Fla.

Alamo uses an IBM Enterprise System/9000 Model 900 running under MVS/ESA.

"If the industry is to adopt a means of measuring benefit

use [of software], that would be a help to the users and vendors," said David Moore, senior vice president at Mellon Bank Corp. in Pittsburgh, a large IBM mainframe shop.

One analyst said Software Meter offers tremendous benefits to users and vendors. "This type of third-party arbitration mechanism is important to both parties. It keeps everybody honest," said Frank Dinebeck, president of Communications Network Architects, Inc., a Washington, D.C., consultancy.

Dinebeck said he expects software vendors to eventually offer users two pricing structures for software — usage-based and flat-rate pricing — so users can "mix and match" the two pricing structures to work out the best deal for their shops.

Dinebeck said mainframe vendors with five pieces of information on customer software use: software product name, customer identification number, duration of each session of software use, frequency of use and platform size and type.

MVS/ESA-based software calls Software Meter through an application programming interface and provides usage measurements determined by the vendor. A counter stores the in-

formation in nonvolatile memory. Software Meter also incorporates security features that alert the vendor if the meter has been compromised in any way.

Software Meter will be sold to software vendors on an OEM basis beginning this month. Implementation of Software Meter requires customers to have a Network Package Switching Interface and access to a public data network.

Prologist Vice President Jo-

Midlevel DASD line debuts for AS/400

BY KIM S. NASH
COWLEY

WALTHAM, Mass. — IPL Systems, Inc. recently extended its product line further down the Application System/400 ladder with a DASD offering for IBM's midlevel midrange machines.

The \$60 million company completed its high-end 9606 direct-access storage devices (DASD) with the 7100 series, a line for IBM's AS/400 model 9404 minicomputer family.

Relatively few vendors other than IBM offer DASD for these machines.

Rx for savings

Lower price entered drug store giant Walgreen Co. to buy 80 400M-byte DASD subsystem from IPL Systems, according to

Don Churchill, chief information officer at the Deerfield, Ill.-based chain.

Walgreen is in the process of upgrading memory on its entire AS/400 installation, which is estimated to be more than 1,500 boxes.

Because he found that the DASD systems for 9404 models are available from third parties are similar to those offered by IBM, "we've been buying them from whoever has the best price," Churchill said. The list includes another independent vendor that Churchill declined to identify, as well as IBM.

The 7100 line, which is available immediately, can be configured as single- or dual-disk drive modules for 9404 B, C, D and E processors, with prices ranging from \$4,435 to \$6,988 per megabyte of storage. The single

IN BRIEF

Navy gets hardware

■ Cable & Computer Technology, Inc., an Anaheim, Calif.-based contractor, last month became the first of three prime contractors in the U.S. Navy's a proof-of-concept development program, dubbed Next Generation Computer Resources (NGCR), to deliver fully compliant Futureshark hardware.

Other contractors include Raytheon Corp.'s Marlboro, Mass.-based Equipment Division, which needs to complete acceptance testing of its NGCR systems before the end of the summer, Cable & Computer Technology officials said. The third contractor, Litton Data Systems, Inc. in Pasadena, Miss., is still listed as part of NGCR development, but the status of its work is unclear, Cable & Computer Technology officials said.

■ A Virginia security systems firm called HFSI recently said that its general-purpose "trusted" computer system had received an E3-level rating from the National Security Agency's National Computer Security Center. The XTS-200 supports client/server applications and enforces security on open systems, according to the company.

drives are available as 320M-byte, 400M-byte or 988M-byte drives, and the dual models come in 640M-byte, 800M-byte or 1,976M-byte sizes.

New markets eyed

IPL already sells DASD products for IBM's top-end 9406 and low-end 9402 AS/400 models. But with the new 9404 line, the firm plans to target the retail and insurance industries specifically.

These users often have AS/400-based point-of-sale setups for which extra DASD would be useful, said Don DeMartino, IPL's product manager.

The latest E-series AS/400 processor, introduced in February, sports improved performance and capacity over previous models, which may help the market for additional disk storage, DeMartino added.

Open or closed? You decide

analysts predict. Oracle, Sybase, Inc., The Ask Cos., Ingres Products Division and Informix Software, Inc. have rollout schedules

that ship versions for hardware platforms in waves. Some platform forms get the latest RDBMS months before others, causing

frustration in mixed-hardware shops.

When users of independent RDBMS packages do open platform or proprietary systems, cost savings from cheaper hardware is often cited as the rationale. At BP Exploration (Alaska), Inc., an investment of \$1.5 million in Unix workstations is expected to save \$2.5 million in annual operating costs. BP Alaska is using IBM's RISC System/6000s as Sybase database servers and Apple Computer, Inc. Macintoshes as clients.

IS managers in the open systems world are seeing greater opportunities to buy packaged applications software and write new applications using fourth-generation languages.

Red Devil, Inc. in Union, N.J., is currently finished replacing its IBM mainframe's, homegrown manufacturing and financial systems with packaged Unix applications from IIS Corp. The packages will run on top of an Oracle RDBMS, AT&T Series 7000 Unix machines will be the servers, and personal computers running Lotus Development Corp.'s 1-2-3 will be the clients.

John Giff, Red Devil's director of MIS, said the removal of the firm's IBM 4381 will save thousands of maintenance dollars — and cut the operations staff from 14 to one.

Give both a try

A brand-new venture gets the chance to hand-pick the elements of its IT infrastructure. Encompass, a global joint venture between AMR Corp., the parent of America Airlines, rail company CSX Corp., and PTT Telecom in the Netherlands looks to link open and closed database systems through client/server applications.

The hosts systems are DEC VAXs, which connect with Intel Corp.-based PCs running OS/2 and IBM's RS/6000 Unix workstations. "We have adopted a message-bus technology that allows our applications to be independent of the database and independent of the network," said Rick Poff, vice president of development and operations at the Cary, N.C., venture.

The VAXs run Sybase's SQL Server database software, as will the RS/6000s; the IBM OS/2 computers run IBM's Database Manager for OS/2. Encompass elected not to run DEC's less-expensive Rdb because of the need to deploy database applications on three types of hardware. "Sybase goes across many platforms," Poff said. "Rdb does not."

Applications development is carried out by 120 programmers using the Uniface Corp. fourth-generation language and Objective C. "One developer in our environment is doing what four to five can do elsewhere," Poff said.

Encompass' systems, based on AMR's Sabre system technology, book reservations for freight shipments and track those shipments along the way. "It's a logistics system that allows trading partners to plan, to execute and to analyze their shipment pipeline," Poff explained.

Among Encompass' customers are Fortune 500 companies, and each of them gets a small Encompass database server in its headquarters.

NEW PRODUCTS

System software

Integrated Solutions, Inc. has announced Graphical Systems Manager 3.0 for the Digital Equipment Corp. VAX/VMS and Unix markets.

The product is a graphical user interface system for enhancing DEC Command Language and Unix Shell commands and managing systems in a distributed or client/server environment. Major changes in this release include an enhanced display server, expanded functionality for open systems and an increased number of display windows and templates for system management functions.

Prices range from \$750 to \$19,000. Integrated Solutions, 1020 Eighth Ave., King of Prussia, Pa. 19406 (215) 337-2282

Ergodic Systems has released MDS32, a menu design system for the Digital Equipment Corp. VAX/VMS.

MDS32 allows users to develop personal computer-quality menu interfaces to VMS-based applications. New capabilities in-

clude the ExpressMenu, a design tool that lets users interactively design and edit an MDS32 application on any ANSI term. ExpressMenu uses function keys, drag-and-drop positioning, pop-up dialog boxes and tool bars.

Another new feature is the condition test, which provides a way to implement security within an MDS32 application. A directory navigator and new user-based licensing options have also been included.

Single-user personal-use licenses for MDS32 cost \$315. Ergodic Systems, 23666-A Birchwood Drive, El Toro, Calif. 92630 (714) 380-9719

Database management

Micro Decisionware, Inc. has announced Database Gateway for DB2 Release 2.0 and DB2-CICS Access Server Release 1.4.

The components were designed to help users who are integrating DB2 and other mainframe sources in client/server applications. Enhancements to the Database Gateway for DB2 and DB2-CICS include Data Compression, Multiple Host

Transaction Identifications and Temporary Storage Management, which bypasses CICS temporary storage, providing a way for results to return directly to the client.

The Database Gateway for DB2 costs \$4,995. Pricing for the DB2-CICS Access Server ranges from \$48,000 to \$125,000.

Micro Decisionware, 2995 Wilderness Place, Boulder, Colo. 80301 (303) 443-2706

Allen Systems Group, Inc. has announced Sedit.DB, an integrated workbench product for the DB2 environment.

Sedit.DB assists users in performing daily development, testing and DB2 management processes. It works in a Dialog Manager application with an ISPF-compatible editor. Sedit.DB's features include formatted editing for data entry, a screen design facility that modifies the display and a catalog query facility. Fill-in-the-blanks DB2 object maintenance and DB2 security administration are also included.

The product includes formatted editing for data entry and a screen design facility for modifying the display.

HP updates MPE/IX operating system

BY MARK HALPER
COWLEY

PAOLO ALTO, Calif. — Hewlett-Packard Co. last week introduced an upgraded version of its proprietary minicomputer operating system, serving notice that, at least for now, it is not putting all of its large systems eggs into a Unix basket.

Many of the enhancements that HP is building into MPE/IX Version 4.0 are aimed at making both the operating system and the HP 3000 series on which it runs less susceptible to system crashes and data corruption and therefore more palatable to data center users.

HP also added support for the Unix networking interface Berkeley Sockets Version 4.3, continuing a company trend of facilitating MPE/IX coexistence with Unix environments. That trend included the addition of Posix compliance last fall and includes planned support for the Distributed Computing Environment, the Distributed Management Environment and X/Open Consortium Ltd.'s XTP transaction processing standard.

Prices for Sedit.DB range from \$18,700 to \$27,500.

Allen Systems Group
7501 11th St. South
Naples, Fla. 33940
(813) 263-6700

Software application packages

Silco-Magnetic Intelligence Corp. has announced two products: the Better-C Version 3.0 program generator for C/C++ and the Top-Down Designer Version 2.0 computer-aided software engineering design tool for C/C++. Enhancements include C++ code generation for Better-C, and Top-Down Designer has been augmented to support object-oriented design specific to C/C++. The Better-C Version 3.0 package consists of a tutorial, library source, program generator and files. Top-Down Designer Version 3.0 consists of interactive designer software and a tutorial.

Better-C Version 3.0 costs \$195, and Top-Down Designer Version 3.0 costs \$399. Silco-Magnetic Intelligence, 24 Jean Lane, Chestnut Ridge, N.Y. 10952 (914) 426-2610

But HP focused attention last week on the reliability upgrades and denied speculation that the company has any near-term plans to run a Unix kernel on the 3000, a move that would verifiably meld the 3000 line with the Unix-based HP 9000 series.

Richard Sevcik, general manager of HP's Commercial Systems Division, said MPE/IX remains better suited for quasio-critical applications than does

THE UTOPIA would be to have one operating system kernel support all environments.

RICHARD SEVCIK
HEWLETT-PACKARD

HP/UX, the Unix implementation for the HP 9000. While HP is striving to make MPE/IX more interoperable with Unix and other operating systems, it intends to continue to base it in the near term on the proprietary MPE kernel, he said. But that firm is "looking into various kernel scenarios," Sevcik said. "The utopia would be to have one operating system kernel support all environments. In the long term, that's our dream. In the short term, that's not going to happen."

HP said it plans to start shipping MPE/IX Version 4.0 by the end of this month. The company said reliability and data integrity enhancements include the following:

- Try/Recover routines that improve the 3000's ability to work around an application failure without shutting down.
- Aggregate parallel recovery, which speeds up operating system reboot in the event of a failure on a typical time of one or two hours on earlier versions of the system to about 20 minutes.
- Redundant arrays of inexpensive disks storage.

Connectivity enhancements include support for Token Ring. HP also added PUI.1 capabilities to the MPE/IX's LU6.2 application programming interface feature, which the company said gives the 3000 peer-to-peer communications with Apple Computer's 4000s and other IBM systems.

HP said other improvements include increases in maximum terminal support from 850 to 2,300, in concurrent processes from 3,119 to 5,466, in maximum file size from 2G to 4G bytes and in disk capacity from 85G to 690G bytes.

IT'S NOT HOW MUCH YOU READ.

You can read a knee-high stack of computer magazines each month and still not find the depth and breadth of news and information you'll discover each week in the pages of *Computerworld*.

As the only weekly newspaper for IS professionals, *Computerworld* is filled with up-to-the-minute articles on topics ranging from products and people to trends and technology. We cover it all—PCs, workstations, mainframes, client/server computing, networking, communications, open systems, languages, industry news, and more.

It's everything you need to know to get an edge on the competition.

That's why over 135,000 IS professionals pay to subscribe to *Computerworld* every week. Shouldn't you?

IT'S WHAT YOU READ.

Order *Computerworld* and you'll receive 51 information-packed issues. Plus, you'll receive our special bonus publication, *The Premier 100*, an annual profile of the leading companies using information systems technology.

Call us toll-free at **1-800-543-1300**. Or use the postage-paid subscription card bound into this issue. And get your own copy of *Computerworld*.

Then you can spend less time reading about the world of information systems. And more time conquering it.

BUYERS' SCORECARD

FileNet surges ahead in imaging satisfaction

BY DEREK SLATER
COWI/STAFF

FileNet Corp.'s WorkFlo leapfrogged over Wang Laboratories, Inc.'s Wang Integrated Imaging System (WIS) to top the Buyers' Scorecard survey on integrated image processing software.

Wang's WIS won a similar survey last December by a comfortable margin. This year, however, WorkFlo topped most areas of the survey and finished with an overall score of 79, followed by Wang's WIS at 76 and IBM's ImagePlus at 72. The 79 score represents a two-point climb for WorkFlo over last year's survey, when the FileNet product finished at 77. The overall WIS score reflects an eight-point drop from last year. IBM's score was three points lower than last year.

Buyers' Scorecard reflects users' satisfaction with their installed technologies. Users assigned ratings on a scale of 1 to 10 in 17 specific categories. The users also rated the importance of each category. (See the methodology on the next page for a description of the scoring process.)

WorkFlo's biggest area of improvement over last year came in capacity to handle work load, rising from a 7.8 rating to an 8.5 rating this year. This change is in large part because of two capacity upgrades of FileNet's Unix Image Server. The latest version, released in May, has twice the capacity of the previous line.

Other jumps for WorkFlo were in compatibility with installed systems (rising from 7.5 last year to 8.1) and overall speed of processing (rising from 7.4 to 7.9).

WorkFlo earned consistently high ratings in the areas users noted as

most important. WorkFlo's lowest scores came in optical character recognition (OCR) and forms processing, an area in which none of the products fared particularly well, and in compatibility with other vendors' equipment.

Slightly more than 50% of the FileNet respondents run their imaging applications on Unix servers with Unix-based or personal computer clients. FileNet recently announced enhancements to its desktop software products, and 18% of the FileNet users reported that they intend to run their imaging applications entirely on PC networks within a year.

Wang's scores fell most significantly in satisfaction with the responsiveness of vendor service (from 9.0 last year to 7.9) and quality of technical support (from 8.6 last year to 7.9), although several users expressed their satisfaction with Wang's support in verbatim responses.

Despite some dissatisfaction with the proprietary nature of the company's VS hardware, Wang's respondents by and large said they do not intend to defect during the coming year. Only 13% of the Wang users surveyed indicated that they will move their imaging applications away from the VS to other systems. Similar percentages of WorkFlo and ImagePlus users said they plan to switch hardware platforms.

Meanwhile, Wang continues to expand its support for new systems under the company's OpenImage strategy. Recently the Lowell, Mass.-based company announced support for IBM's RISC System/6000 platform, which analysts foresee as a critical imaging platform in coming years (CJW, June 22). Wang's implementation will let users operate a central

Integrated imaging software

Total scores reflect average user ratings for all measured topics, weighted by user-assigned importance. Response base: FileNet, 37; Wang, 32; IBM, 43.

Total possible score **100** Mean score **76**

Product	Highest ratings	Lowest ratings
FileNet's WorkFlo SCORE 79	Work flow management Responsiveness of vendor service Image-capture ability	OCR and forms processing features Compatibility with other vendors' equipment Cost of purchase and implementation
Wang's WIS SCORE 76	Reliability Capacity to handle work load Ease of use	Compatibility with other vendors' equipment OCR and forms processing features Overall cost of purchase and implementation
IBM's ImagePlus SCORE 72	Capacity to handle work load Responsiveness of vendor service Reliability	OCR and forms processing Overall cost of purchase and implementation Text-retrieval features

VS system to run imaging applications while RS/6000 units function as image servers. The RS/6000s will be rebadged as Wang RISC Series Servers.

ImagePlus' 72 score is three points lower than last year's result. However, in the most important categories, buyers rated the product about the same as last year, and ImagePlus jumped notably in the area of ease of use (7.4, compared to 6.8 last year). Declines came in OCR and forms processing (4.7, down from 5.4), text-retrieval features (6.4,

down from 6.9) and overall cost of purchase and implementation (5.9, down from 6.2).

IBM's software runs on several platforms, but a great majority (76%) of the ImagePlus respondents reported using a mainframe or Application System/400.

Overall, 83% of the users said their imaging systems delivered the increase in productivity that they expected when they purchased them. IBM, Wang and FileNet are the pioneers of image processing, with more than 500 installations each. *

RATINGS IN ORDER OF IMPORTANCE

FileNet's WorkFlo sweeps the first six areas with consistent ratings. Users rate reliability and capacity to handle work load as key issues in imaging applications.

(Additional ratings on next page)

User importance rating:

9.3 Reliability

9.0 Capacity to handle work load

8.8 Responsiveness of vendor service

8.6 Image capture capability

8.7 Quality of technical support

8.7 Ease of use

RATINGS IN ORDER OF IMPORTANCE

(Integrated imaging software, continued from previous page)

WorldFlo maintains high ratings, placing first or second in all remaining categories.

8.3 Work-flow management features

7.9 Depth and accessibility of documentation

7.2 Compatibility with other vendors' equipment

8.5 Compatibility with installed systems

8.0 Overall cost of purchase and implementation

7.7 Amount of customization required

6.3 Text-retrieval features

8.4 Overall speed of processing

7.9 Application development tools

7.3 Ease of installation

6.2 OCR and forms processing features

Verbatim

What do you like best/about this product?

(Based on the most frequently stated answer. Quotes are selected from users' responses.)

Likes

Work flow controls

"We can develop applications that also measure and manage business activities."

Dislikes

Not flexible
"It lacks flexibility in reporting what it has indexed."

Likes

Ease of use
"It's menu-driven and easy to use."

Dislikes

Not flexible
"We'd prefer a generic application instead of having them come in and customize it for us, which is more expensive."

Likes

Integrates well with existing systems
"We like the way it integrates into all of our systems."

Dislikes

Not flexible
"The front-end work flow manager is not flexible enough."

Loyalties

Would you buy the product again?

METHODOLOGY

Products included in this Buyers' Scorecard are the Top 3 market-share leaders among integrated image processing systems.

User names were provided by nonvendor sources. First Market Research in Austin, Texas, conducted the survey and tabulated the results. The response base was 37 users for FileNet, 32 for Wang and 43 for IBM.

To compute the overall score for each product, perform the following steps: 1) Multiply the product's score in the first category by the user importance rating for that category to obtain the weighted score. 2) Repeat the process for all remaining categories. 3) Average the resulting figures for the average weighted score. 4) Convert the average weighted score to base 100. The ratio of the average weighted score to the average user importance rating is equal to the ratio of the overall score to 10. Numbers are rounded off where necessary.

RESPONDENT PROFILE

Respondents reported using the following hardware platforms: Wang or other minicomputer, 27; IBM AS/400, 24; Unix server, 19; mainframe, 11; PC network, 8; other, 25.

More than half of the respondents said they view increased productivity as the most important benefit obtained from their image processing software. Improved speed and improved customer service, as well as increased storage space, were also cited as benefits.

Primary applications addressed by these imaging products include insurance, accounting, storage and retrieval, customer service and inventory/order entry.

Respondents said they would like to see the following features added to their products:

- More open systems.
- More functionality.
- Better voice or image annotation support.
- Better documentation.
- Better integration capabilities.
- Higher speed.
- Enhanced security.
- More color capabilities.
- Integrated work flow.
- More connectivity.

ACKNOWLEDGMENTS

Computerworld thanks the following individual and firm for their assistance in preparing this Buyers' Scorecard: Bruce Silver, BRS Strategic Decisions; CW Database Division.

NOW THIS IS WHAT WE CALL DOWNSIZING!

Goodbye of mainframe computer! Industry leaders have already decided: They're going to faster/smaller/less expensive computers based on open systems standards. And Data General is leading the way! Our AViiON® Systems can give you 117 MIPS of mainframe power that fits in a pizza box for a downsized starting price of under \$100,000! Unbelievable, you say? Believe it, we say! Here's what AViiON can mean to your business:

- Increased savings because AViiON costs millions less than traditional mainframes—plus you save on maintenance, software, power, etc.
- Increased productivity because AViiON allows your different computers to work together as a corporate resource.
- Increased information storage capacity and security thanks to the availability of AViiON's fault tolerant disk array.
- Increased and immediate "mainframe class" performance using the leading databases, business applications and communications software.

- Increased envy from your competitors because you took advantage of open systems for a competitive edge. Data General AViiON systems.

That's where the world is going.

And we want to take you with us.

Call 1-800-DATA GEN

Data General

Where the World is going!

The AViiON System. Mainframe power that fits in a pizza box and saves you millions!

Eiffel to add speed, application builder

BY MELINDA-CAROL BALLLOU
CW STAFF

GOLETA, Calif. — Interactive Software Engineering, Inc. (ISE) is scheduled to announce and begin shipping a new release of the company's Eiffel object-oriented software development environment next week. According to company officials, the release significantly shortens compilation times and offers an application builder.

The components of Eiffel 3.0 include: EiffelBench, the programming environment that offers an incremental compiler/interpreter; EiffelBuild, an application builder; EiffelVision, a class library for development of graphical applications and user interfaces; EiffelBase, with basic class libraries; EiffelStore, a class library for database interfacing; EiffelCase analysis/design tools; and ArchiText structured document constructor.

New with Version 3.0 is ISE's Melting Ice technology, which allows developers to execute applications as they are being built rather than having to wait for them to be compiled.

"One of the complaints about Version 2.3 was that it was a compiled environment, and people had to wait for applications to compile before they could test their [new code]," said Philippe Stephan, chief engineer at ISE.

"Now you start with the compiled system — the frozen system — and then during the day, as you make changes, what you change is interpreted. Eiffel also checks a program before executing it," Stephan said.

GUI builder

The new EiffelBuild interactive application generator is a program that lets users design graphical user interfaces and then link them with Eiffel code. The links between the user in-

ISE's Eiffel 3.0 includes Melting Ice technology that allows developers to execute applications as they are being built.

terface objects and the code "are accomplished via a drag-and-drop mechanism, which lets you link any graphical object to any Eiffel code," Stephan said. The

product supports both the Open Software Foundation's Motif and Sun Microsystems, Inc.'s Open Look X Window interface. Also new with this version are

libraries that have been added around reusable components: the EiffelVision library and EiffelStore, which lets users interface with databases, including those from Oracle Corp., Informix Corp. and Versant Object Technology.

Users said they were enthusiastic about the new version of Eiffel.

The length of compile and link time has always been a problem, not just with Eiffel but with other object-oriented languages as well, such as C++," said Dave Butler, a consultant at Sandia National Laboratory in Albuquerque, N.M. "If 3.0 performs as advertised with the Melting Ice technology, it will be an extremely desirable development environment indeed, and we are eagerly awaiting it."

The new version is slated to ship next week for Unix, VMS and AIX. EiffelBench and EiffelBuild are both priced at \$995; EiffelBase and ArchiText are \$495 each; EiffelVision is \$1,495; EiffelStore and EiffelCase are \$1,995 each.

CA's strategy to merge Xbase line begins to gel

BY THOMAS HOFFMAN
CW STAFF

NEW YORK — Computer Associates International, Inc.'s plans are coming together for the merging of its Xbase product line with the products of the recently acquired Nantucket Corp.

CA's two-pronged strategy will eventually bring the two product families together under a long-range project initiated by Nantucket.

CA Chairman and Chief Executive Officer Charles B. Wang said the company will offer its Xbase users two paths to reach its ultimate Xbase environment: the object-oriented programming path of CA-Clipper and the graphical user interface path of CA-dBase with Microsoft Corp. Windows support. Both paths will eventually lead to CA's next-generation Xbase platform, Aspen.

"We see two paths to the Xbase world: object-oriented programming and graphical user interface," Wang said. He added that both paths provide users with immediate benefits while protecting and leveraging users' investments in application development with the eventual migration to Aspen.

Wang added that all of CA's Xbase products, which now run

under Windows, will eventually be ported over to IBM's OS/2 2.0, Unix System Laboratories, Inc.'s Unix and the Open Software Foundation's Motif operating systems as well.

Aspen, which was being developed by Nantucket prior to the acquisition, will be equipped with an object-oriented language, a native code compiler, an integrated development environment and the dBaseStyle used by Borland International. It's the dBase product line and client/server databases. Aspen will be available under Windows first, followed by versions for OS/2 and other platforms. Compatibility kits for applications in other Xbase environments, including dBase III and IV and Fox Software, Inc.'s FoxPro, will also be available.

Development path

Wang said Aspen will be demonstrated at Comdex/Fall '92 in November and is scheduled to be available for beta testing in the fourth quarter. Wang said CA intends to deliver Aspen to its customers in the first quarter of 1993.

"The good news is independent software vendors and users who have been waiting anxiously for Aspen to hit the scene. Many users breathed a sigh of relief in

May when CA announced its intention to acquire Nantucket.

Although users interviewed said they were satisfied with Nantucket's Clipper environment, they said they felt uncertain about the firm's financial statement and its ability to meet development and shipping deadlines.

"The state of Nantucket's finances made it difficult for them to continue to develop and upgrade Clipper," said Al Acker, a senior software analyst at Cybernetics, Inc., a Grand Junction, Colo.-based Clipper application software developer.

Initially, a small percentage of Clipper users reacted unfavorably to CA's acquisition of Nantucket, Acker said, because these users had developed relationships with Clipper engineers. Wang said CA has retained almost all of Nantucket's Clipper developers. In fact, Nantucket President Larry Heinenberger is staying on with CA as director of Xbase strategies.

Acker said most Clipper users look favorably on the acquisition. He said he is impressed with CA's strategic direction with Clipper and Aspen because the \$1.4 billion Ithaca, N.Y.-based software giant has the financial resources to expand the Xbase product set beyond Nantucket's capabilities. If CA "follows through on their statement of direction, I view it as good news," Acker said.

According to Wang, CA-dBaseFast, which is currently available in Version 1.7C, will be up-

graded to Version 2.0 by November for release at Dev-Con, a Nantucket independent software developers' conference in Clipper in Boston.

Enhancements for CA-dB-

Fast 2.0, now in beta testing, will include an active directory/repository, a visual application designer, a visual report designer and improved performance of the database engine.

Cadre backs UnixWare, agrees to port Teamwork

■ **Cadre Technologies, Inc.** endorsed Univel's UnixWare, an operating system for Intel Corp.-based desktop and server co-developed by Unix System Laboratories, Inc. and Novell, Inc. Providence, R.I.-based Cadre will begin to port Teamwork, a family of application development tools, to UnixWare when it receives an early copy of the system, which is expected this year. Meanwhile, Westboro, Mass.-based Hyperlink Corp. announced that its Hyperlink Distributed Object Management System will support UnixWare.

■ **Visible Systems Corp.** added forward and reverse engineering features to Visible Analyst Workbench, a suite of computer-aided software engineering (CASE) tools. The Watertown, Mass.-based company, which specializes in CASE tools for IBM's Application System/400 line, and the product lets users build data models for planning and generating applications in C language, Cobol and IBM's Cross System Product External Code Format.

■ **Progressive Application Renovation**, a graphical user interface builder from Burlingame, Calif.-based Unimark Systems Corp., is now available from three consulting firms: Marathon Systems, Segue Partners and Information Integration Consulting.

■ **Lufthansa German Airlines** has licensed Canadian Plan, a frequent flyer system from Canada's Unimark Systems Corp., is based on a template developed with Texas Instruments, Inc.'s Information Engineering Facility CASE workbench.

Everybody talks a in corporate America. some of th

These are just some of the Microsoft products that can help you build applications for Windows today.

As we speak, Windows[®] development tools are providing MIS and corporate developers with everything they need to solve their critical business problems.

Just take a look at the winners in the First Annual Windows World Open, recently held in Chicago. These companies and government agencies, along with dozens of other entrants, are solving real problems by developing applications using a wide variety of Windows programming tools. And so can you.

Today, there are hundreds of Windows development tools available. It's no problem mixing and matching products from different vendors. Just pick whatever tools you need to get the job done, and start developing.

So if you're thinking about a PC-based solution for your company, and you'd like some additional information on the complete line of Microsoft[®] Windows development tools, give us a call at (800) 541-1261, Department HD3.

We'll be happy to help solve your problems.

CHEVRON

Chevron's LAN system clients asked for a PC-based corporate directory to give PC users a "phonebook" similar to the one on their mainframe. The problem was there was no solution on the market that could accommodate 45,000 records with 30 fields each. To solve their problem, they used Visual Basic[®], MicroHelp Muscle for Visual Basic, VBTools, EditTool, ButtonTool, and Ramia Data Manager to create CLSctn for Windows. Now the users have an easy-to-use directory that allows them to access information by several different indexes.

U.S. NAVY

Navy ships were drowning in paper. The Chief of Naval Operations has estimated that it was costing \$400 million per year to store, access, control and update the vast amounts of required technical information. Using Microsoft C, the Windows SDK, Microsoft Word for Windows and Excel, they developed the Interactive Electronic Technical Manual. It allows them to store all of the volumes of technical information on a CD-ROM, which can be accessed with the click of a mouse.

about the problems We'd like to talk about the solutions.

ORLANDO HEALTH CARE GROUP

Orlando Health Care is a 52-physician practice providing HMO services at 6 medical facilities. They had a problem tracking and updating over 100,000 medical charts, because patients can receive services at any of the facilities. So they used Microsoft Visual Basic, Q+E™ Database Library, Microsoft SQL Server, Microsoft LAN Manager, and Select Comm Server to create the Master Patient Index, a systemwide database. The new system saves time and helps the company provide better quality health care.

PHH FANTUS

As an economic development consulting company, PHH Fantus analyzes enormous amounts of data. Some of their studies require the analysis of over 450 industries, and with the old manual system, it could take over 200 man-hours. To make their operation more efficient, they used Microsoft C, the Windows SDK and db VISTAIII Database Management system to design "Forté," a giant repository for data on a network server which is continually maintained and updated. Analysis that once took weeks now takes just hours.

ANSETT AUSTRALIA

As an airline, Ansett Australia needed to provide a better information system for its users. The old system forced users to wade through a large printed book for flight information. To solve this problem, they created the Ansett Travel Planner, with Microsoft Visual Basic, Windows SDK, Microsoft BASIC Professional Development System. Now it's much easier to update and access flight information. And there's a database that can store travel preferences for customers.

OTIS ELEVATOR

Senior Management needed a more accurate and timely way to consolidate all the financial information that was coming in from Otis companies around the world. So they used Microsoft C and Microsoft Excel along with Bridge Tool-Kit and Keyworks to create CFO, an executive information system. Now the analysts and executives can quickly access important data that'll allow them to spot and react to business trends.

Microsoft
Making it easier

Information Builders targets Windows

BY THOMAS HOFFMAN
ENR STAFF

NEW YORK — Information Builders, Inc. (IBI) recently introduced performance boosts for its application development environment with the debut of Levels Object Release 2.5 for Microsoft Corp.'s Windows 3.0 and 3.1.

The software is an object-oriented, knowledge-based application development tool that IBI upgraded from its earlier Release 2.2. IBI has added new data interfaces and performance improvements to the upgrade.

"The new version is a lot better than Release 2.2 because you can move your screens onto the mainframe," said Jerry Kessler, project leader of the application consulting team at Navistar International Corp., an Oak Brook Terrace, Ill.-based manufacturer of truck and diesel engines. Kessler was referring to Release 2.5's ability to access remote mainframe data in addition to its direct data access capabilities with personal computer databases.

Kessler beta-tested Release 2.5 for three months before purchasing the product last month to upgrade Navistar's copy of Release 2.2. He noted other improve-

ments over Release 2.2, including better performance, better object structure and improved compiler messages. Kessler said Navistar is considering using Release 2.5 to convert its Levels Object Release 1.3 users who require IBM mainframe data access.

According to Sean McCarthy, a marketing manager at IBI, the Windows development tool also enables users to achieve distributed data access with IBI's Enterprise Data Access/SQL 2.0, a client/server software package and a part of IBM's Information Warehouse. Release 2.5 also supports full implementation of

SQL and offers a Dynamic Data Exchange interface, which is one of several interfaces included with the new package. McCarthy said the added features were implemented as a result of user requests. "In Windows, everything is changing so rapidly that vendors are trying to compete with new features all the time," McCarthy said. He added that IBI is currently beta-testing an MVS version, which is slated to ship next month.

In addition to its ability to run in Windows 3.0 and 3.1 environments, McCarthy said Release 2.5 also works in Windows running under IBM's OS/2 2.0 operating system.

Levels Object Release 2.5 is available now, and it is priced at \$995 for the development system.

PRODUCT SPOTLIGHT

The joy of X... terminals

The X environment — once mysterious to commercial sites — turns out to be user-friendly as it starts to serve some very everyday needs

BY STEPHEN AUDITORE

Maybe it's the letter "X." Maybe it's their roots in an MIT research project called "Athena." Whatever the reason, for a lot of commercial users, X terminals are shrouded by some mystery.

In reality, there's nothing overly exotic about the work being done by these intelligent, diskless devices. In fact, they're helping users perform some pretty down-home tasks in areas such as computer-aided software engineering, computer-aided design, database query, on-line transaction processing and groupware. They're also shipping in larger numbers than ever before, with nearly 120,000 X terminals sold in 1991, up from 12,000 units shipped in 1989.

On the other hand, an X terminal is not your basic terminal. It was designed explicitly to run the X Window System, a hardware- and network-independent windowing and graphics protocol — now a de facto industry standard — that allows users to view all systems computing elements on a single screen as if they were one large computer.

X terminals running X allow users to simultaneously view many different applications residing on heterogeneous computers across the network also running the X Window System. The X terminal itself does not process the applications; it performs all the tasks necessary to display them in a graphical way on its high-resolution screen.

Backward world

In some ways, entering the X world can be like walking through the looking glass. For one thing, the concept of client and server are reversed. An X terminal — a desktop device — comes bundled with its own proprietary version of what is called "X (server)" software. The soft-

Auditore is president of the X Business Group, Inc., a market research and consulting firm in Fremont, Calif.

ware sends and receives X protocol commands to the machines on the network, called "hosts," that run the applications — known as the "clients." This is because, technically speaking, the networkwide clients are sharing the "server" resource of a high-bit-mapped display.

You don't need an X terminal

while PCs are better used by people who use X sporadically.

X terminals have become an attractive option because they offer the following:

- Can be administered like a simple terminal.
- Offer a lower cost seat.
- Are easier to administer and support.

to deliver X-based applications to the desktop. You could use a workstation or a personal computer running X server software (see story page 69). But generally, workstations are more expensive than X terminals to purchase, maintain and support,

• Do not need to be upgraded whenever a new generation of workstation becomes available.

All this probably sounds great, but there are some drawbacks — real and perceived — to using X. For one, there is a lack of X-based commercial ap-

plications. However, many X applications will likely be mission-critical, proprietary applications, such as billing, planning, customer service and documentation systems. The key applications driving the acceptance of X in the commercial sector will not be third-party, shrink-wrapped applications but database management systems and fourth-generation languages that support X. Oracle Corp. and The Ask Cos.' Ingres Products Division already offer products that support X-based database application development.

Some people also bemoan the impact of X terminals on the network and the hosts they rely on for processing. However, it's the application that determines the traffic level, not the total number of X terminals of the network. The more windows, or applications, that are opened simultaneously, the more resources are required. Other factors that affect network traffic include the type of window activity and the amount of information sent to a window.

One way that X terminal vendors are working to minimize network traffic is to use local window managers; that is, the processing required to manage the terminal's windows is performed on the terminal rather than somewhere across the network. If the window manager runs on the host, high levels of window activity can increase network traffic.

Keep in mind, however, that the very nature of X — highly user-interactive — creates a sporadic-burst pattern, which should minimize its impact on the network loading.

Selecting an X terminal

Unlike traditional terminals, an X terminal is not a display product. The size, resolution and type of display is certainly important; most nontechnical customers settle on midsize color displays (16 to 17 in.), with 1,024 by 768 or 1,280 by 1,024 pixels, supporting eight-bit planes of color.

But an X terminal is actually a
Continued on page 68

X marks the vendor

BY JIM ROYMAN

The following market leaders offer a range of X terminals, from lower price monochrome to color models. Each is committed to open systems products, offering workstations and other open systems hardware and peripherals in addition to X terminals.

• Network Computing Devices, Inc.

Overview: Currently dominates the X terminal market, out-selling its nearest competitor by a 3-to-1 margin. First to incorporate a reduced instruction set computing (RISC) chip. Sole directly to users, particularly strong in Sun Microsystems environments. Tends to concentrate on the middle — rather than the high — end of the market. Prices range from \$1,495 to \$5,395.

Weaknesses: Prices are higher than comparable X terminals from competitors. Serial port support limited to ANSI.

• Tektronic, Inc.

Overview: Has established technical dominance in the X terminal market. Historically the first to announce many new technologies, such as a 19-in. X terminal. Recently added a machine with PEK, which allows the X terminal to use client/server implementations of the standards body-approved graphics language PHIGS, or Programmers' Hierarchical Interactive Graphics. Markets its products primarily at the high end. Offers eight X terminals, ranging in price from \$2,495 to \$4,995.

Weaknesses: Design incorporates a separate processor unit that is cumbersome and requires the attachment of several cables to its function. Processor unit must sit either alongside the display or on the floor. On/off and power indicators are not conveniently located nor easily visible.

• Visual

Overview: First to bring an X terminal to market and only one here that concentrates almost exclusively on X terminals. Rapid TX product line fulfills software-selectable resolutions and timing to ensure compatibility. More than 10 X terminals in its product line, ranging in price from \$995 to \$6,055.

Weaknesses: The company's sales consist almost exclusively of monochrome units, which have an interfaced display, known for being tiny to the eye over extended periods of use.

• Bucomm Designed Systems

Overview: Awarded what is believed to be the single largest order of X terminals ever, from the U.S. Army Reserve Component Automation Systems (RCAS), through Boeing Computer Services, for about 50,000 of its ViewStation FX series. Tends to focus more on integrating X terminals into an environment than on direct sales to end users or distributors. Price ranges from \$1,499 to \$5,999.

Weaknesses: Only recently became a major X terminal maker with significant sales and revenue. Questions remain as to its ability to keep up with new RCAS production and distribution in the wake of its recent award.

• Hewlett-Packard Co.

Overview: Has made significant strides in high-end X terminals. RISC-based models are solid and well-engineered and boast top-notch benchmark performance. With the success of its 9000 series workstation and respected X terminal line, HP is making a push into the high-performance graphics market. Prices range from \$2,995 to \$5,995.

Weaknesses: HP terminals, like those of Network Computing, tend to be slightly higher priced than competitive units.

• Digital Equipment Corp.

Overview: Optimized for DECworkstations and VT-320-based applications. Recent announcement of the XVT 2000 line lowers the low end of its offerings from \$2,195 to \$1,999. The new models feature menu-driven operation, reduced network overhead and simultaneous access to Unix, Ultrix and VMS host applications.

Weaknesses: Heavy reliance on large installed base of Ultrix and VMS users to move toward open systems may preclude the company from marketing its X terminals to non-DEC users.

Byron is an analyst at Bucomm Consulting, Inc., a consulting firm in Mount Laurel, N.J., that specializes in Unix and open systems.

The joy of X... terminals

CONTINUED FROM PAGE 67

software and network product. A successful deployment of X terminals relies on the software and the degree to which the device affects network traffic.

The leading X terminal suppliers recognize this, with Network Computing Devices, Inc., Hewlett-Packard Co., Digital Equipment Corp., IBM and Tektronic, Inc. all offering very sophisticated X server functionality.

Choosing among the more than 30 vendors offering more than 200 different X terminal models, then, is really a matter of checking out their software, their compatibility with your installation, their support capabilities and the ongoing administration that their terminals require.

Software variables

The current version of the X Window System is X11 Release 5.0. Few X terminal vendors are shipping this release, but X is backward-compatible, meaning that X11 Release 3.0 applications will run with X11 Release 4.0 and Release 5.0 servers.

The software components of many X terminals include the following:

Local clients. These are programs that, in the X world, have traditionally run on the network but now run in the X terminal. The rationale behind local clients is that they can reduce the host and network load by providing services that would otherwise be supplied by host- or network-resident clients.

Common local clients include window managers and terminal emulators. Nearly all X terminal vendors support local clients of various types, with Applied Digital Data Services, Inc. (a subsidiary of NCR Corp.), DEC, Network Computing and Tektronix offering local window managers.

When you're shopping for X server software, look for the following:

- X11 revision: R4 or R5.
- Network management: SNMP.
- Local client support: Window managers (Motif), terminal emulators.
- Font server support.
- Network protocols: TCP/IP, DECnet and LAT (if DEC).
- Ease of installation: Tape availability, installation scripts, graphical user interface-based setup, remote configuration capability.

Fonts. Until the latest release of the X Window System, font handling on X terminals was a cumbersome task. Release 5.0 improves on that by providing a font server that runs on the network. The font server processes all font requests, converting them to a common format that X terminals understand.

Network management

Quick reference comparison | X terminals support X the best, but they are not as good for local applications

	X terminals	PCs with X	Workstations
Cost/Seat	\$4,000-\$4,500 (17-in. color monitor)	\$4,700-\$5,800 (16-in. color monitor, 486-23)	\$5,400-\$6,500 (16-in. color monitor, dualbus)
Network requirements	Increases network traffic	Increases network traffic	Significant increases in network traffic
Host requirements	<ul style="list-style-type: none"> • 18-24 Mbytes per X terminal • 1.5 MBPS per X terminal* • 10 Gbit memory swap space 	<ul style="list-style-type: none"> • 18-24 Mbytes per X terminal • 1.5 MBPS per X terminal* • 10 Gbit memory swap space 	Min. 16 Mbytes memory on host
X performance	Good to excellent	Poor to adequate	Good to excellent
Use profile	<ul style="list-style-type: none"> • Heavy I • No host applications • Historically industrial users • Commercial use a fast-growing segment 	<ul style="list-style-type: none"> • Casual I • Heavy local applications 	<ul style="list-style-type: none"> • Mixed I users • Local workstation applications
Applications	Mission-critical vertical, UDP publishing, database access, GIS, office automation	E-mail, database query, relational vertical applications	CRM/CRM, CASE
Advantages	<ul style="list-style-type: none"> • Larger life cycle cycle • Network-appropriate (drawing power neutral or adding capacity to network) 	<ul style="list-style-type: none"> • Leverages PC investment • Better access to PC applications • Integrated w/PC environment 	<ul style="list-style-type: none"> • Full workstation compatibility • No application compatibility issues
Issues	<ul style="list-style-type: none"> • No local processing capabilities • Requires network processing • Host I terminals connected to network • (Confusing) resistance from workstation users • Life cycle cost high 	<ul style="list-style-type: none"> • Performance of I server • Compatibility with installed PC options • Installation, ease of use • May require PC upgrade • Configuration support • Life cycle cost high 	<ul style="list-style-type: none"> • Expenses to increase drawing capability • Not optimized for I server functionality • Life cycle cost high • Security risk • Administration difficult (backup, support)

terminal suppliers to offer multitask boot support in the future.

Far from being "dumb" devices, X terminals usually sport a powerful processor, often a reduced instruction-set computing (RISC) CPU. The processor is what runs the X server software, using the memory or program and session storage.

The memory in the X terminal fulfills several needs, including running the X server, storing fonts, storing dynamic information relating to windows, local clients and video memory (usually video random-access memory).

But more memory is not always better. The memory that really matters is the amount not occupied by the X server. For example, Product A may have 5M bytes in a standard configuration, while Product B has 4M bytes. But Product A requires 1.5M bytes for its X server while Product B uses only 500K bytes. Which is better? Know what the memory is used for and how it is allocated.

The amount of local memory required is based on the number of windows open, the fonts in use and the type of information in the window. If you are doing mostly textual applications with less than four windows open, 2M to 4M bytes should be adequate.

Anything else will require at least 4M bytes, and if local clients such as a window manager are added, then more is needed. For a reference point, an official Open Software Foundation Model window manager requires approximately 500K bytes of memory.

Communications

Communications between the X terminal and the X client are effected via standard network protocols and wires. Most networked X connections use Transmission Control Protocol/Internet Protocol, using the Ethernet protocol, running on a thin, thick or twisted-pair medium.

While most of the benefits of X are derived from being on a network, many organizations still use serial connections, especially where X terminals are replacing conversational terminals. If you don't have a network and aren't going to install one but want to use X, look at products that can connect via a serial link, such as those from **Quinc Corp.**, Network Computing and DEC.

It may be necessary to run an X terminal from a remote location or over a serial line. Depending on the transmission speed, supporting remote X often requires an optimized low-bandwidth X protocol. Possible protocols include Point to Point Protocol, XRemote and Serial Line Internet Protocol, or SLIP.

The next generation of X terminals will feature more powerful hardware (RISC processors, expanded memory, more input devices) and will further increase its software capabilities.

Elements of the graphical user environment, such as multiple work spaces and desktop managers, will become resident in the X terminal. The X Window System will eventually become invisible to users.

Further into the future, X terminals will be replaced by terminals that are optimized for a specific user environment and interfaces. There will be Motif terminals, Open Look terminals, DECwindows terminals, Desktop terminals, HP/VUE terminals, Microsoft Corp. Windows NT terminals, Solaris terminals, and on and on. ■

Casual X: PC X servers give users a bit of both worlds

You can have your X and PCs, too, with personal computer-based X server software.

PC X server software allows the PC to function as an X display device while retaining its DOS and Microsoft Corp. Windows — or Commodore Business Machines, Inc. Amiga, IBM OS/2 and Apple Computer, Inc. Macintosh — functionality. So far, a good number of companies have opted for this route, with the current installed base (including Digital Equipment Corp.'s Pathworks) exceeding 222,000 users, with most running under DOS or Microsoft Windows.

In fact, one of the most important trends in the PC X server market has been the increased demand for Microsoft Windows-based PC X servers. Windows and X integration permits users to view DOS, X and Windows applications simultaneously and allows cutting and pasting of data and information between applications. Windows' PC X servers also allow users to employ Windows' local window manager, which lends the Windows look and feel to X applications while reducing network traffic.

But PC X servers are not for everyone. As vendors of the software have discovered, converting a PC to an X-capable device is not an easy thing; in fact, it can be more difficult than adding an X terminal to the network. For one thing, you may be in for a significant degree of upgrading, including the following:

- More memory.
- A network interface card.

- Network software.
- PC X software.
- Higher resolution displays and graphics adapters.

To achieve a reasonable level of X performance with minimal impact on the local DOS/Windows environment, you would need at least an 80386-based 33-MHz PC (in the Intel Corp. environment), with 8M bytes of random-access memory, a 14-in. color display and at least Video Graphics Array, preferably Super VGA resolution.

The fact is, PC X server software does not turn a PC into an X terminal. The inherent hardware and software limitations of PCs limit their performance and functionality as X display servers. Although PC architecture and memory management have taken some great strides, DOS is still a single-user operating system constrained by 640K bytes of conventional memory, which significantly limits application size and multitasking capabilities.

As with workstations, networked PCs also require a higher level of attention from the network administrator than X terminals. PCs with X servers do not offer the life cycle cost advantages proffered by X terminals.

X-equipped PCs are best left for casual X application use, such as people who only need occasional access to X applications. For example, the aerospace, petrochemical and manufacturing industries often have X-based database applications — usually archives of technical manuals and documents. Since these applications tend

X on the PC

The following are a sampling of PC X software vendors.

- AGE Logic, Inc.
San Diego
Software for DOS and Windows
- Apple Computer, Inc.
Cupertino, Calif.
Mac/XT for Macintosh
- GPXbase
Milpitas, Calif.
GPXbase for the Amiga
- Hummingbird Communications Ltd.
Markham, Ontario
HCL-Exec for DOS and Windows
- Network Computing Devices, Inc.
PC-X Division
Mountain View, Calif.
PC Xview for Windows and DOS
- Visioware (Unispex Software, Inc.)
Edison, N.J.
Xvision for Windows
- White Pine Software, Inc.
Nashua, N.H.
Xodus for the Macintosh

to be for query and display purposes, not data entry and update, it's a good use for PC X servers.

X on PCs will work well for organizations with a large investment in PC hardware and software that want users to have some access to X-based information resources and database applications. This will be especially true as commercial market segments such as telecommunications, banking, insurance, financial services, hotels and the airlines.

STEPHEN AUDITORE

Performance — Xstones vs. the Rolling Stones

No matter how hard vendors have tried to promote a single-number benchmark for X terminals, one does not exist.

Some suppliers (usually those with the biggest number) have been promoting "Xstones." Xstones is derived from an X server development tool called "X-bench," developed by Siemens/Nudorf Information Systems, Inc. It shows the performance of the X server software in a computer-aided software engineering (CASE) environment and does not factor in a non-CASE environment, user interaction and network traffic.

Another benchmark in use — developed and maintained by DEC — is

X11perf. This suite of more than 400 tests provides ratings of how well the X server performs various X primitives. Several of these ratings have been grouped into values called "DXUPs." By evaluating the application against the DXUPs, you can garner some idea of how well X terminals will run that application

relative to each other.

Hewlett-Packard Co.'s Panacom Division has published several application- and terminal-specific performance test papers that provide more insight into X terminal and system performance than any of the benchmark programs in use.

ds Of A Macintosh.

QUADRA OUTRUNS THE 50MHz 486

19.71

Now, the computer that helps you get more done can help you get it done faster.

Faster than what? Faster than a 486[®] Windows[™] PC, according to PC Week. In its benchmarks (at left), an Apple[®] Macintosh[®] Quadra[™] powered by a 25 MHz Motorola 68040 beat a 50 MHz 486 Windows PC in two tests out of three. And was about 33 percent faster overall.

No surprise, really. Macintosh and its graphical user interface were designed from the start around the 68000's true 32-bit architecture. Naturally, it outperforms a computer powered by an extended 8-bit architecture running a character-based operating system with a tacked-on GUI.

That's especially true when the Macintosh is powered by a 68040. With two on-chip caches and an internal 50 MHz clock, the 68040 outruns everything in its class. And even faster versions are on the way.

So if you're in the market for a high performance graphical computer, there's only one way to go.

Go Macintosh Quadra. Go 040. Or go slower.

Tales from the land of X

Wrong number, wrong address

Even users with impeccable technology credentials can create minor disasters with X Window System terminals. Such was the case at the US West NewVector Group in Bellevue, Wash., where employees use X terminals from Applied Digital Data Systems running over a network to Sequent Computer Systems, Inc. computers. One of their main occupations is monitoring cellular phone switches.

For instance, if the tower light fails, says Bill Holt, manager of production for open-system administration, that information is passed over the wide-area network to the Sequent computer, which displays it on overhead screens. If multiple problems appear to be hitting at once, "the [tech staff] can bring up the window related to the specificity and iconize it off, so it's there if the problem occurs," Holt says.

But one day the system kept crashing. Since X terminals act like nodes on a network, Holt explains, each one has its own address. Users have to correctly input their own terminal's address and the address of the machine they're going to communicate with.

"We had a situation where the user reversed those numbers," Holt says. It was hours before the user reported a correlation between the crash and his attempt to access the system. "Very few X terminals offer protection of the basic setup configuration," Holt says.

This system is described by US West's Holt as a miniature movie theater, and everyone has a full panoramic view.

Please support me

"Know thy vendor" is a proverb that worked especially well for Henry Camp, president of Medical Systems Development Corp. (MSDC). His company selected X terminals two years ago for Atlanta-based Grady Memorial Hospital to run the Thersa medical software produced by MSDC.

The 400 X terminals were to be installed on an Ethernet LAN and run off DEC VAXs. The hospital decided to switch from dumb terminals because of the complexity of patient information that doctors need to evaluate.

Camp says it was critical to find a vendor committed to helping Grady resolve the technology

concerns particular to a hospital. The chosen company was Westboro, Mass.-based Visual, which has fulfilled its share of special requests. When the hospital wanted to have the terminals print directly to local printers in 1989, Visual made it possible for printers to attach to the terminal's serial port and capture host data, instead of requiring separate wiring. And since the hospital also required barcode readers, Visual adapted its readers to fit in the keyboard connection available on the terminal.

"I think a willingness to accommodate changes is extremely important for X terminal manufacturers compared to ASCII terminals," Camp says.

Getting your wires crossed

For Jim Honerkamp, selecting an X terminal for the brokers at McDonald & Company Securities, Inc. in Cincinnati was a no-brainer: At the time, only Network Computing offered a localized windowing manager, which helped limit the amount of network traffic.

The plan was for the brokers to make trades at their desks using the X terminals, as well as log on to a remote stock quote system. But once the terminals were selected, Honerkamp says, director of computer services at the Gradsion Division, the company discovered that its existing wiring scheme wouldn't work.

"We had a four-pair wire, and we were using one side for

phones and one side for dumb terminals," Honerkamp says. "That didn't work with X terminals because you couldn't have the phone signal running over the same physical wire."

Fortunately, the company had also decided to install a one-way broadcast system conveying brokerage news through a speaker on each broker's desk. That system was hooked up through the telephone wire.

Then Honerkamp turned the X terminal wiring problem into an opportunity by trying a new technology: connecting the X terminals to the LAN via Motorola, Inc. Altair wireless LAN units.

Currently, ceiling-suspended

"control modules" (connected to the LAN with twisted-pair wire) broadcast radio signals to "user modules" that are in turn connected to groups of X terminals with twisted-pair wire.

"There's no wire between the user module and control module," Honerkamp says, "so it drastically minimizes the amount of wire that you have to pull."

"We're spread across two floors of a two-tower building," he continues. "If I had 70 dead runs [of wire] from my computer room, I'd get into big bucks. Instead, we run about 10 and still drive 70 terminals."

P5*

digitat™

We don't just outperform other PCs. We help them catch up.

For all their big talk, other PC companies' service claims are equally airborne. Not Digital's. We've got over 10,000 of our own service people across the country. Ready to deliver on-site service that's not a glorified messenger service. And ask about our Multitutor® Support which covers you PCs from vendors such as Apple®, Compaq®, AST, Dell® or IBM® — as well as software from Microsoft®, Novell® and Lotus®, to name a few.

There's no sticker shock with Digital — compare their "options" with our standard features.

Shipping is included. (Ask what they charge.) Lifetime Technical Support. 24-hour FAX Support. And a 30-Day Money Back Guarantee. And in the unlikely event something should ever go wrong with a 400ST model or any personal computer from Desktop Direct™, you'll benefit from our no-fine-print On-Site Service for one full year after purchase — at no additional charge.

Every Digital Notebook comes with a One-Year Return-to-Factory Service Warranty. Telephone Support and unlimited repairs, as well as our 30-Day Money Back Guarantee and a 24-hour FAX line!

Digital's Upgradable 400ST Series

we take you all the way there

7P5

You wouldn't want to board a plane that can't take you where you need to go. So why buy a PC "upgradable" that can't go the distance?

Only Digital™ has the technology and engineering expertise to land you safely in 7P5* territory today. Thanks to our exemplary and industry-standard upscalable Xpress EISA architecture, the 7P5* will fit every 400ST Series PC like they were made for each other.

After all, they were made for each other.

While all those other "upgradables" will leave you waiting around for some add-on that hasn't been designed yet. Or emptying out and rebuilding the PC altogether.

Why crash and burn with another PC that runs out of gas?

Soar with Xpress EISA today. The 400ST sets the pace with its 386 processor. And because Digital's designed for you as a single user system or a network server, it can take you wherever you want to go, the way you want to go.

No matter which system you choose, we offer you a system with 4MB to 192MB of storage ranging from IDE to 852MB.

More. Six EISA Bus Master slots. Of-the-art standard VGA monitor. Powerful color resolution options.

And, of course, it's all yours. It with Microsoft Windows.

IN DEPTH

Information access for all

What if TV sets cost a little more, computers almost nothing and everyone could tap into national databases containing anything in print?

BY DAVID H. ROTHMAN

Some high school students in Silver Spring, Md., have been working on an affordable virtual reality system for small business. While a finished system won't go on sale next week at Radio Shack, the students' work has been good enough for a top Army laboratory to hire one of them for the summer. Ten years

from now, all three students might be cherished employees at Intel Corp., IBM or another high-tech company. Gloria Seelman, a research coordinator at Montgomery Blair High School in Silver Spring, sees the ongoing project as an educational success. Students' brains and tenacity have helped. But so has something else. Via Dialog databases, students at the school can dial up many facts missing from the school library.

Without databases, Seelman says, the work done so far might have taken twice as long. As it happens, even the University of Maryland lacked perhaps half of the books helpful to the project, and interlibrary loans would have meant weeks of waiting. The databases, unfortunately, offered citations but not full texts of books.

Imagine how much the Blair students could have accomplished by now in their three-semester course in Independent Research if they could have downloaded whole books, if they had not been limited to the offerings of libraries nearby. Suppose that they could easily hook up with an electronic version of the whole Library of Congress. In fact, suppose that millions of other students, parents — anyone — could retrieve technical tomes, novels, articles — almost anything ever published. Suppose, too, that they could read the material on laptop comput-

Rothman is author of *The Complete Laptop Computer Guide* (St. Martin's Press, New York) and other books on high tech.

ers that sold for \$50 or, even better, were provided free of charge by the government.

Farfetched? No. For years, computer hackers and librarians have dreamed of being able to read any book on-line. And now technology has come far enough for this to happen in the next two decades, through a plan that I'll propose here. My TeleRead plan would promote literacy, increase general exposure to computer technology and aid our

ers for research and development. Rather, the government would use revenue from a 10% tax on television sets and other video products to buy laptops for schools and libraries, ensuring enough of a market to justify the R&D in the private sector.

Extrapolating from a Department of Commerce statistic on annual sales to consumers, such a tax might raise \$2 billion a year. This tax needn't be burdensome. Let's

say a television cost \$350 and the owner kept it five years. He would pay a tax of \$35, or 10%, when he bought the set; that would break down to just \$7 annually, or about the price of a pizza.

A tax would hardly kill off television or double SAT scores, but it would send a message about new priorities for the country.

Some general tax revenue might augment the money from the "Tube Tax" if need be, but not necessarily forever. The TeleRead program could collect subscription fees, determined by family income, from people downloading books and other material from the network.

Spending spree

Just how would TeleRead spend its money at the start?

One of the program's goals would be to develop an instant market for trailblazing U.S. companies in areas such as screens and memory chips. With massive procurement contracts, the government could hasten the coming of powerful, toaster-simple laptops selling for a tenth or twentieth of the cost of today's models. Right now such machines seem to be at least two decades off, if you want them to have sharp color screens.

TeleRead contracts would clearly favor computers with screens and other parts designed and manufactured in this country. Domestic companies couldn't avoid all foreign technology, of course. But the TeleRead program would nurture our R&D as much as possible, especially in crucial fields.

Continued on page 78

Tom Clark

domestic high-tech industry.

Under TeleRead, millions of Americans could dial up books from home via a giant computer network. The government would encourage Silicon Valley to turn out small, affordable computers with sharp American-made screens that you could read more easily than a book.

No, Washington wouldn't pay laptop mak-

Here's the plan

- Use money from 10% sales tax on TVs to underwrite R&D by U.S. companies on notebook computers you can read like a book.
- Give these computers free to all schools and libraries, and make them available at a very low cost to everyone else.
- Develop national databases of new and existing published material.
- Create a national network to provide easy access to these information stores.

Results: A boost for U.S. high tech; better educational opportunities for all citizens; and a more literate and technically proficient labor pool.

Continued from page 77

such as laptop screens and memory. Simply put, the program would make high tech safer for our often skittish venture capitalists without setting up a massive research bureaucracy or resorting to an onerous tariff, such as the one that the Commerce Department slapped on some LCD screens.

Promotion of U.S. high technology, of course, would be just one of TeleRead's purposes. With money from the Tube Tax, the federal government could give away laptops to many schools and libraries and ultimately to bright students from low-income families.

Our schools need more computers. According to statistics published in the 1992 Computer Industry Almanac, U.S. public schools had one computer for every 20 students last year. What's more, programs for the gifted and talented enjoy a disproportionate share of the machines.

Corporations donate equipment in some districts, but the flow of gifts is too small and too haphazard to do much good nationwide.

Even in affluent areas, many schools are hanging on to Apple Computer, Inc.'s Apple IIs and other antiquities and are wishing they could offer their students something better, according to Vicki Hancock, an educational technology expert at the Association for Supervision and Curriculum Development (ASCD) in Alexandria, Va.

Benefits on every level

TeleRead, of course, shouldn't just buy computers. It should also help pay for computer literacy instructors for students, teachers and librarians so the machines wouldn't sit around unused in closets. Everybody would master the basics of on-line searching, the high-tech equivalent of the Dewey decimal system. Teachers would learn how to dial up books and other material in their specialties to enrich their classes.

"This program would benefit average students as well as gifted ones, and it would better prepare Americans for work in an information-dependent society," says Hancock, editor of the "ASCD Curriculum/Technology Quarterly."

"Schools should teach everyone to find and analyze facts from many sources, not just regurgitate from textbooks," she says.

Jeremy Gordon, a third-graduated senior who worked on the Montgomery Blair project, agrees. "When I go to the public library," he says, "I see

long lines of students in front of the CD-ROM magazine index. An on-line national database would be incredibly useful."

Trinet, part of the TeleRead program, would offer Gordon and his peers an electronic cornucopia. This national network would carry the full texts of all new books and other publications.

Operation phase in

The way this would come about is that the government would begin to require all material longer than 10,000 words to be in digital form in order to be copyrighted. The government would phase in this requirement gradually, perhaps with a voluntary program. Many authors and pub-

lishers would rush to take advantage of Trinet, seeing it as a new market; after all, most publishers today are already using computers to set type. As for undigitized material shorter than 10,000 words, scanners could pick up the images.

In all cases, TeleRead would pay fairly. If you wrote a book, for example, your earnings would depend on how often people dialed it up. Of course the network would not need to pay anyone for items already in the public domain—for example, government publications, statistics and old literary classics. So the basic Trinet service might be free or cost very little, even for nonstudents.

Mind you, Trinet would be just one option for readers. People could still buy books, either the old-fashioned kind or the electronic variety, from publishers or authors themselves. That would be one way to cope with the risk of censorship.

Using what we've got

A public network is an essential, however, if we want broad-based, affordable access to a wide selection of books and other material.

Some skeptics might call this naive socialism, but it isn't—any more than a public library is.

If Andrew Carnegie, that 19th-century capitalist extraordinaire, were alive today, he would probably be funding demonstration projects, just as he helped small-town libraries across the U.S., hoping that ambitious Americans would use the technology of the day to better themselves and their earning potential. ■

Yes, there is literature ready to be downloaded

Two decades ago, Michael Hart had a vision. Although most of the people he tried to describe it to thought the idea was crazy, Hart was convinced that someday, hundreds of millions of people would own computers and want to use them to access research books and great works of literature.

Since then, Hart, an adjunct professor at Illinois Benedictine College in Lisle, Ill., and a small army of volunteers across the country have transferred several dozen books, mostly classics such as *Alice in Wonderland* and the Bible, into electronic form for free distribution. He goal these days is 10,000 free on-line texts by the end of the year 2001. Computer-world assistant editor Kelly E. Dwyer recently spoke with Hart about this ambitious undertaking, which is called Project Gutenberg.

Q What is it that compelled you to make this project your life's work? What's your driving force?

A Our goal is for a reasonable fraction of the population to be able to get a reasonable fraction of the information that they want, without having to do any more than say, "Hey computer, have you got Aristotle's *Poetics* in here?" and it will say, "Bing! Here it is." If 75% of the people could get 75% of their questions answered, we'd feel a certain amount of success. It would be even better if 90% of the people could get 90% of their questions answered.

Whatever books people look things up in the net, that's what we want to publish. We'll eventually publish phone books, encyclopedias, the dictionary. We've got a thesaurus and an almanac already. If we knew exactly the 10,000 books that people wanted to look stuff up in the most, those are the ones we would do. It's purely utilitarian. People ask me why I do it, and the really big answer is, "Because it's there."

Q Why aren't hard-copy books that are free from libraries enough?

A When you go to the library, the books can be already checked out, they can be in for rehousing, they can be on the wrong shelf, they can have their pages torn out of them. You aren't supposed to write in them, you have to bring them back; if you don't bring them back on time, you have to pay a fine.

For me to get *Alice in Wonderland* off of one of our computers here takes me a local phone call, which costs a nickel; or, if I ride my bike over to the computer, it doesn't cost me anything. And if I get 20 books, it still only costs me a nickel for the phone call. And I can dial up and get *Alice in Wonderland* and never have to take it back.

The reason for electronic text instead of paper is it's cheap, universal—it can be translated into every computer language that's ever going to come up. Any computer you're going to find, you can run one of our books on.

Q Reading off a screen doesn't seem like the most comfortable or natural way to read a book.

A As people get screens that are more and more to their liking, it doesn't bother their eyes so much to read them on the screen. And eventually we'll have screens that look just like paper anyhow.

Q How many texts are currently on-line?

A We've got about 24 to 26 on our machine in particular. We don't have enough space to keep the old ones. Carnegie Mellon University has a collection of our stuff. I don't know, they've probably got 50 things that we did. We've got several different editions of the Bible, a couple different editions of *Paradise Lost*, *Aesop's Fables*, things like that.

I'm sure *Alice in Wonderland* is our most popular title. It was our flagship book for a long time. Anybody who wanted to experiment with Gutenberg, we just sent them *Alice in Wonderland*.

Q How many volunteers are now working with you on this project? Who are they?

A We've got a population in the low hundreds. And they're about evenly divided between the volunteers who help us do copyright searches and locate old editions that we can use and the people who actually enter the books themselves.

We've got everything from little old ladies in the middle of Vermont typing away at old *Atanas* and *Apples* to people who are full-timed professors. People from all over the world enter all the text. I get boxes in the mail with a book and a disk that say, "Here, I typed in this book; here's the disk."

Q What are your goals? How many books would you like to see on-line? How many copies distributed?

A I expect 100 million readers by the end of 2001. The basic home library is going to be 10,000 books. Our goal by the end of the year 2001 is for people to be able to store our entire library of 10,000 books in 10,000.

I am seriously predicting that it will cost a penny to store the average book on a floppy by the end of the year 2001. Right now it costs a nickel to store something like *Alice in Wonderland* on a 1.44M-byte floppy.

Q How do you currently distribute the texts? Do you foresee using other distribution means down the road?

A We mail disks around to people who can't get on the Internet, bulletin boards post our texts for people that don't have any network connections and others will just call up on the phone and get them. A lot of it is just hand-to-hand. There's a Btinet connection besides an Internet connection.

Internet is still the easiest way, in my opinion, because you can use FTP. And with FTP, even with a really slow connection—where you're getting 5K bytes per second—that's still only 30 seconds to get *Alice in Wonderland*. You couldn't possibly walk down to the library and get it as fast as you could dial up. ■

The TeleReader circa the year 2012

It's the year 2012. TeleReader designs have evolved slowly over the years. Washington did not just ask for bids and then settle on a permanent design. Instead, it has awarded contracts in stages.

The first machines cost a great deal and were far less powerful than the model you own today. But they did encourage the use of TRnet, which the government started as soon as possible to get publishers to digitize their offerings. Here's what the TeleReader looks like and what it can do after 20 years of evolution:

Form

The machine comes with two detachable parts. The first is a keyboard with a built-in trackball. The keyboard is big enough for typing but small enough to carry around comfortably, and it can even fold up.

The second part is a thin, lightweight, detachable screen that contains the CPU and memory chips, which are the true guts of the computer, as well as a tiny loudspeaker.

The screen measures 12 in. — small enough to be compact, but large enough to be read comfortably. You do not see even the slightest flicker. Also, the screen uses vivid color to help hold your attention, and it can offer charts and drawings in detail.

Functions

• **Access.** You fetch books and articles via phone wires or cellular radio. Throughput at the start of the TeleRead project was as high as 38.4K bit/sec. and now, after 20 years, can exceed 1M bit/sec. in many cases. Superfast speeds are possible even without fiber-optic wiring in homes, schools and libraries if telephone companies update their switching equipment.

• **Search.** You can use the trackball to work your way through a Macintosh-like menu. Your screen shows that you have millions of choices from books, newspapers, magazines and professional journals. But not to worry. You needn't structure your queries much at all. TRnet uses artificial intelligence to help you zoom in on your exact topic.

• **Knowledge collection and personal.** You can read directly

from the screen, open up another window and take notes or use the built-in speaker to listen to audio material (such as a speech you are reading). You can prop up your TeleReader screen on a table using a built-in stand, place the keyboard on your desk for extended work sessions or detach

the screen for comfortable reading. • **Knowledge retention.** The TeleReader stores at least a gigabyte of data, the equivalent of about 500,000 double-spaced, typewritten pages. You can hold thousands of books, and if you want to exchange data with

friends, you can plug in memory cards. Because TeleRead relies on flat subscription fees and reaches a huge market, sensible authors do not really mind people sharing their books. As a rule, writers get paid more handsomely than when readers spent so much money on cardboard, paper and ink. DAVID H. ROTHMAN

Effective Data Storage Management™ A Breakthrough In AS/400® Storage

XL /Datacomp, the world's largest independent provider of IBM® AS/400 equipment, now offers a full range of tape and DASD storage devices that can help you achieve faster, safer, more cost-effective access to data.

For all the exciting technological advances made in the IBM midrange computing environment in the last five years, there has been almost no change in the way data is stored. Until now.

Today, XL/Datacomp offers more choices for cost-effective data storage on disk and tape than ever before available.

to the IBM AS/400 user. These choices include 18-track cartridge, 8-mm cartridge and reel-to-reel tape subsystems that make back-up both easy and cost-effective. Our new 9336-compatible DASD subsystems offer levels of performance and reliability never before available to the AS/400 user.

Each features optional hot-spare technology for data protection and cache technology for high performance.

Alpine: A New Idea

We've just released the Alpine 9600 Storage Manager™, a fault-tolerant, disk-array subsystem that is the first AS/400 storage device to provide continuous operation through redundant components and RAID 5.

(Redundant Array of Independent Disk) architecture.

Alpine sets a new standard in data availability and protection. Key components are hot-pluggable and may be replaced without disrupting operations.

Planning for Growth

With more choices available and more coming, you will want to build a sound storage procedure for today and

have a growth plan for the future. To aid you in that process, XL/Datacomp provides you with a strategy with which to realize the benefits of Data Storage Management (DSM).

DSM shows you how to store data on the type of device that provides the best level of performance and protection. The result is a multi-level storage environment, a mixture of high-speed alternatives for needs and

cost-effective devices to handle less time-critical tasks. As we make new alternatives such as solid-state DASD and automated tape library systems available, you can incorporate them into the DSM strategy to take the best advantage of each type of device.

To find out more about the new XL/Datacomp line of storage devices, or the ways you can put DSM to work to improve the access and cost-effectiveness of your data storage, call for the FREE booklet "Guide To Effective Data Storage Management."

Take Note

Have you developed an outstanding Notes application?

If so, stand up and be noted by entering Computerworld's 1992 Lotus Notes® Application Awards competition.

With Notes rapidly becoming a driving force in workgroup computing today we want to recognize innovative developers like you who are enhancing information management for your workgroup.

Some Notes on entering our competition...

All entries should be Notes applications currently in use (not a prototype). Entries may be based on applications developed by an end-user organization, a systems integrator, VAR or Lotus Notes Alliance Partner.

Announcing Computerworld's 1992 "Lotus Notes® Application Awards"

What do your Notes look like?

Some of the notes our judges will take when looking at entries include:

- Innovativeness of the Notes application.
- Return on investment that the Notes application delivers to the organization.
- Impact the Notes application has on the organization's productivity and competitiveness.
- Solution the Notes application provides to a business problem.

Winners will be announced during a private reception and dinner attended by all finalists on the evening of October 13 (during the week of the Network World show in Dallas).

To request your Lotus Notes Application Awards Entry Kit...

Sue Thaxter
Computerworld
375 Cochituate Road
Framingham, MA 01701
Tel. (800) 343-6474, ext. 738

Computerworld's 1992 Lotus Notes® Application Awards® entry kit contains all details, rules and qualifications for this contest. Content is valid where provided for here. No purchase necessary. Content is open to all end users, customer representatives and IBM organizations except employees of Lotus Development Corporation.

Deadline for entry is Midnight (EST),
July 29, 1992.

MANAGER'S JOURNAL

EXECUTIVE TRACK

Elise J. Ross has been promoted to the post of corporate vice president at The New York Times. In her new position, Ross, 48, will be responsible for all information systems and communications for the newspaper company's information and publishing systems, including the development of IS and new technology strategies. Ross formerly served as vice president of systems and technology at the paper.

Campbell Travel is making Money: In fact, the Dallas-based corporate travel management firm is making him an IS consultant. Denney Money, formerly operations manager at food flavoring manufacturer The Van Tine Co., came aboard at Campbell earlier this year to help supply the firm with a competitive distinction by way of technology-driven, individual tailored customer services.

Cherri Musser is the new manager of the IS strategic business unit at Texas Instruments, Inc.'s Enterprise Systems Business. Musser, who joined TI in 1973 as a business applications programmer/analyst and has risen steadily through the IS ranks, takes on the IS stewardship of a unit focused on four areas of application development software: procurement, order processing, customer management and electronic data interchange. She is responsible for internal TI's Corporate Business Systems, comprising marketing, logistics, control and administration.

There's a new hand on DEC at Computer Methods Corp. The Livonia, Mich.-based software and consulting firm last week announced that Ernest Ritterhaus is its new divisional manager in charge of operations group focused on consulting with the firm's Digital Equipment Corp.-based clients. A 14-year computer industry veteran, Ritterhaus most recently founded a software firm, Devenir Corp.

Imaging: It's a jungle in there

IS directors blazing trails in imaging are wise to learn from others' mistakes

BY NELL MARGOLIS
CW 11077

Whoever said "What you don't know won't hurt you" never tried to implement a large-scale imaging project.

To the contrary, say information systems directors who have navigated the perils of the huge projects that are emerging as cornerstones of corporate re-engineering efforts at banks, insurance firms and other large companies: The first and perhaps worst mistake IS directors can make is to have down the imaging fraud kidding themselves that they're on familiar territory.

"Imaging as a pure technology has been around for a good while, so people tend to think they know their way around it," says George Hewlett, corporate vice president at New York Life Insurance Co. But they don't. Hewlett and others who have been there say.

Bungalow blues

New York Life recently whittled down to manageable size a plan to port virtually its entire business on an imaging platform; the company is striving toward its ambitious goal one finite business process at a time. "Nobody has died over this," Hewlett says, "but that doesn't mean the IS people in charge aren't taking a lot of antacid tablets."

The U.S. Patent Office so underestimated the technical complexities and time requirements of an early image-based automated patenting process that the schedule was pushed back three years. Assistant IS Commissioner Thomas Giammo said. The cost to the patent office? Time, money and at least one career," says Wick Keating, vice president at Arlington, Va.-based systems integration firm American Management Systems, Inc., which was

called in to consult on the project.

Second thoughts rarely come cheap on imaging turf, where "the average significant project starts out in the \$1 million to \$2 million range, and the sky is the limit," Keating notes.

But while there is no guaranteed safe route through the deceptively virgin territory, canny IS leaders can hedge their bets by heeding the cautionary tales that are filtering back from early explorers.

For starters, Hewlett says, "There's a need to recognize that the power curve for document imaging is simply not the same as it is for item processing." Not only does the bit count surge, he says, but the parameters change. "The forms aren't the same size. Suddenly, you're dealing with myriad colors, shapes, sizes, paper weights — and with myriad complexities, especially associated with indexing and recognition."

While the power demands are likely to exceed your expectations, the compatibility of the various hardware and software components lashed together into an imaging system are likely to fall short, warns Frederick Bauer, senior

systems project administrator at Baltimore Gas & Electric Co. (BG&E). "Be wary of the word 'Open,'" he says. "Every vendor out there professes to have open systems, but when you get down to the nitty-gritty, they don't talk to each other."

Stumbling blocks

As part of a five-year re-engineering plan kicked off about 2½ years ago, BG&E recently committed to image some 200,000 pages of technical, procedural and business textual information critical to the operation of its Calvert Cliffs, Md., nuclear plant. Phase II, which will load drawings into the system, is next.

The Calvert Cliffs project stalled midstream, Bauer says, when emulation software selected partly on the basis of its alleged openness balked at communicating with the plant's extensive Novell, Inc. network. While bridging the communication gap did not add dollars to the utility's contract price, Bauer says, "it held up production for about three months. We knew going in that we'd probably run into some

Continued on page 83

When the going gets tough . . .

In imaging, as in all re-engineering activities, the thorniest problems are cultural rather than technological. As veteran management consultant Michael Hammer says, "The soft issues are the hard issues." And two of the hardest, IS heads agree, are the work-force cuts often triggered by work-process improvements and finger-pointing that can start when the virtually inevitable imaging project analysis set in.

A raft of imaging pioneers offer two rules of thumb: When it comes to staff cuts, act quickly, decisively and with constant communication; when it comes to blame, don't act at all. "If you don't reduce work force, you don't get the efficiencies that the new way of working was planned to attain," management consultant Rex M. Scott notes. "But you've got to be careful to do it in a way that leaves [the layoff survivors] excited and not preoccupied with fear for their jobs."

Scott had to walk that narrow line recently when, as director of operations and chief financial officer at Rocky Mount, N.C.-based Unitary Bank & Trust Co., he helped spearhead the \$140 million bank's installation of a check processing imaging system. "We told our employees what we were doing early, we told them why, and we told them everything at once," he said. "That helps."

Reticence, even undertaken with the best diplomatic intentions, can go hideously awry. American Management Systems' Wick Keating added: "One company whose name I can't reveal geared up an imaging team and didn't tell them that the goal of the project they were working on was a 40% reduction of their own ranks." The news leaked anyway, Keating said. "You can just imagine how hard everyone was working to make sure the project got implemented," he added.

Chase cuts over to Metrotech

New York bank consolidates three IS facilities into single Brooklyn site

BY THOMAS HOFFMAN
CWI STAFF

NEW YORK — A data center grows in Brooklyn.

In an effort to save money on prime Manhattan real estate and to consolidate its back-office operations, Chase Manhattan Bank NA is in the midst of a \$500 million consolidation project.

The \$97 billion bank is currently moving the bulk of its back-office data center operations — such as domestic and international money transfer and check processing — from two sites in Manhattan and one on Long Island to a new facility in Brooklyn. By September, the bank said, the facility will house 7,000 Chase employees.

The new facility is called Metrotech. It's the brainchild of New York City officials, who are desperate to keep the remainder of large New York-based businesses from moving their operations out of the city to areas in which real estate is less expensive. The Security Industries Automation Corp. is also in the process of moving into the Me-

trotech site.

Consolidation is nothing new to Chase, the nation's fifth-largest bank (ranked by assets). Chase's parent company, Chase Manhattan Corp., has consolidated 100 data centers to 58 sites during the past two years, according to a report issued earlier this year by Salomon Brothers, Inc.

The report said the consolidations have saved Chase \$29 million annually, with further consolidations, such as Metrotech, expected to double those savings within two years.

Chase executives declined to project cost savings for the consolidation efforts related to Metrotech. However, Anthony Minko, vice president of telecommunications at Chase and the Metrotech telecom site manager, said the firm expects major productivity gains to result from the new networking equipment being installed.

Chase's Metrotech environment will consist of 62 IBM-bit IBM Token Ring local-area networks with an Ethernet backbone. At the heart of Metrotech is AT&T's Systemax PDS, a complex yet flexible wiring hub that supports all of Chase's voice and data communications.

Jerry Cafaro, AT&T support manager for the Chase project, said the Systemax PDS installation at Metrotech is AT&T's largest to date. Minko said the AT&T Systemax PDS will provide Chase with a common link among its mainframes throughout the world.

To date, the bank has installed one IBM Enterprise System/9000 Model 900 mainframe and has funding for one more this year and space for three more mainframes in the future. Chase is also installing a Unisys Corp. 2200/900 mainframe to support check processing, several hun-

dred Digital Equipment Corp. VAX minicomputers and several Storage Technology Corp. ACS 4400 automated tape library subsystems.

Over Memorial Day weekend, Chase was scheduled to move its data center from New York Plaza in Manhattan to Metrotech. Uni-Data and Communications, Inc., a Flushing, N.Y., systems integrator, has been contracted to install Chase's hardware in Metrotech during a one-year migration.

According to Daniel G. Hoffman, vice president of sales and marketing at Uni-Data, Chase's equipment at Metrotech will mirror current Chase technology at the bank's offices in Manhattan and at its Lake Success, N.Y., data center.

The command center is expected to be production-ready by September. Additional equipment to support the command center will be installed in August. Minko said the facility is configured to eventually support up to 11,800 workstation users.

Minko noted that Chase considered moving these operations to New Jersey until four years ago but was persuaded by city officials to remain in New York. "Besides, Chase has been in New York for 200 years," he added.

TI launches program for IS personnel

DALLAS — Amid ever-increasing demand for improved information systems support staff, Texas Instruments, Inc. is making a move on the supply side.

TI's Employee Development Center, launched in April, is a pilot program aimed at making sure that IS personnel get all the career training and advising they can soak up — and, importantly, that they get a good deal of it from their department and division managers.

Under a senior adviser program that is a formal part of the pilot, managers turn mentor, advising staff members on topics likely to clear and widen career paths. Development Center head Sue Hensley said.

While actual senior advisory meetings are held in confidence, Hensley said, typical discussions "include progress vs. self-expectation, technical resources available, technical trends, organizational cultures, policy and procedures and training recommendations."

HARD Q

Can you increase production

With EDS, the Indiana Dept. of Transportation answers yes.

The Indiana Department of Transportation increased the output of its engineers 60 percent without increasing the size of its staff. They did it with the help of a powerful EDS-developed client/server graphic database system. The system is also making roads safer and saving millions of taxpayer dollars.

EDS created the Geographic Information System (GIS) to assist engineers in the design and drafting of new roadways. It's the first system of its kind to combine detailed topographic data and computer graphics all on one screen.

Engineers using the system can view every road, bridge and waterway in Indiana

Imaging: It's a jungle in there

CONTINUED FROM PAGE 81

problems, but we didn't know it would take this long."

In fact, Bauer adds, the utilities are drawing an ironic moral from watching one another's trials and errors in the imaging arena: "Those that have a network already are at a disadvantage."

The First National Bank of Chicago, an early adopter of imaging for both check processing and commercial documents, learned the hard way that processing images puts unique demands on an existing computer infrastructure.

"We first tried to put documentation on the mainframe using an early version of IBM's [ImagePlus] system," says Gamil Sakla, assistant vice president at the bank. "But it clobbered the CICS system," he adds. "You can't mix transaction processing and imaging."

Tough advice though it is, imaging pioneers widely agree that the best guide to implementing a major imaging project may be that which you learn from your own early mistakes. Vicarious experience is a less expensive and harrowing alternative — help yourself to a heaping portion, IS leaders recommend:

- "The criticism of an up-front feasibility study cannot be stressed enough," says Mark Olson, deputy vice president of student financial and information systems at Columbia University in New York, now shepherding the sprawling 15-college university through an effort to put some 70,000 financial forms into an imaging system expected to be up and running by Christmas. Columbia spent eight months on vendor selection alone.

- And don't short training and staffing requirements as you draw your blueprint, Olson adds: Many have, and many have paid.

- "Interview some of your vendors' other customers," Bauer says. And kick the tires, early and often. "I would insist on an on-site demo of every piece of equipment you buy," he says. "Make the vendors prove not just that it works, but that it works in your context, to the requirements of your plan."

- Make sure your first attempt is finite and noncritical, Hewlett cautions. No one at your company will thank you for having a learning experience on mission-critical turf or time.

Above all, Hewlett and others

say, be mindful at all times of the fact that imaging is not an evolutionary technology so much as it is a revolutionary corporate cultural change. "Don't expect to

get rid of paper early in the game," Hewlett says. "That won't happen. It can't. The biggest question we still get asked by people working with our new imaging system is, 'When can we print it?'"

Midwest bureau chief Ellis Booker contributed to this story.

Why ask why?

Don't assume you need a professional systems integration firm to see you through an imaging attempt, says Frederick Bauer, senior systems project administrator at Baltimore Gas & Electric. And don't assume you don't, either.

"This is a highly individual decision," Bauer says. "If you're modeling on another firm's experience, don't ask whether they used an integrator. Ask why." BGE, for instance, partnered with American Management Systems on the first phase of the Calvert Cliffs project. For Phase II, Bauer says, the firm plans to leverage its Phase I experience and proceed ahead without outside integration aid.

If your own business goals and IS capability in fact lead you to reach for an ally, notes Mark Olson, deputy vice president of student financial and information systems at Columbia University, don't run right to a professional services firm. "See what [your imaging hardware and software vendors] have to offer by way of systems integration services," he says. Vendors are scrambling to establish themselves as ace service providers and might do a lot to add to their success stories. What's more, Olson says, they made your equipment, so they know where the bones are buried — and where the potential lies.

COMPUTER CAREERS

No rest for the weary? Time off doesn't always equal vacation

BY JILL VITIELLO
SPECIAL TOUGH

It's July 6. Have you planned your summer vacation yet? If not, you might want to consider taking off a full week or even two. Really, the boss insists. Many forward-thinking information systems managers are starting to see the health and corporate benefits of well-rested, well-balanced employees.

"Time off is an important part of our attitude about a healthy work style," says Nick Barth, president of Armor Systems, Inc. in Mattituck, Fla.

This attitude comes as a change for a work culture that for many years prided itself on long hours, heavy eyes and stacked-up vacation time.

"As a general rule, computer people like to work, but overwork is detrimental to your health," says Harold A. Sample, data processing manager at Amerenda Hess Corp. in Jackson, Miss. "We've all seen those walking zombies who never take their vacation time."

Some companies permit employees to store up unused vaca-

tion time from one year and carry it over to the next, thereby building up allowable days off. However, many IS managers now frown on that practice and encourage time off when time is due. "Our employees work hard and need

sure on IS professionals, and it's not hard to see why IS employees really need to take several consecutive vacation days."

The trend toward shrinking IS departments, too, has forced many IS professionals to feel they

hind the office, wonder says.

"Some families are so busy they hardly ever see each other unless they pack up their bags and head off together. They look forward to and cherish these times together," says Peter W. Mason, a travel marketing expert affiliated with the Travel and Tourism Research Association.

Others, like Sharon Moses, systems manager at Plochman, Inc. in Chicago, are taking vacation days out of business trips, thereby saving themselves airfare. Moses recently visited family members in California after a business trip there.

In fact, spending time with family is the No. 1 reason people give for wanting to take time away from the office.

Have PC, will travel

However, many IS workers admit that the work doesn't stop even while they are away from the office. "Actually, IS people can do a lot of our problem-solving work in our heads. Even when we're relaxing, our minds are working," Sample says.

Ironically, the very people who enable others to tote their offices anywhere — IS employees — are the same people who never get a break from the office. In addition, because offices are so portable, the lines of distinction between work and leisure have blurred.

Most who are out of the office for even a few days will check

their voice mail and electronic mail. They leave phone numbers where they can be reached in emergencies, and they solve problems or handle users' questions over the telephone or with remote dial-up access from their laptops to the company's computers.

"With my computer, modem and fax, I can literally take my office with me on vacation," says James E. Bell, director of IS at the Colonial Williamsburg Foundation in Williamsburg, Va.

Most everyone agrees that interruptions are inevitable; they simply come with the territory.

Of course, not all IS professionals stay accessible while away from the office. For example, many at Atlantic Electric Co. in Pleasantville, N.J., choose true getaways such as fishing trips, says Michael G. Barnes, director of technical services.

However you opt to do it, taking time away from the routine of daily pressures improves job performance in the long run.

"We all need a break in the action," says Alan Misi, director of IS at American Steamship Co. in Buffalo, N.Y. "After a vacation, people return to work refreshed, with new ideas and increased energy."

Sound good? Then what are you waiting for?

Vitello is a speech writer and travel writer based in East Brunswick, N.J.

to take their vacations when due," Barth says.

This change in attitude has a lot to do with the new pressures implicit in the job. IS has always been in an extreme environment, but today that's more true than ever.

"As a rule, IS jobs are high-stress," says Richard Wonder, president of the New York/New Jersey regional of Robert Hall International, Inc. in New York. "Add to that the fact that recessionary times put additional pres-

sure to take on extra tasks and work even longer hours.

Although just about everyone acknowledges the benefits of vacation time, it's tough to get IS professionals to truly take a break.

In fact, the trend for many IS people today is to skip out for a couple of days, not a whole week. These people fear shorter, more frequent breaks, saying it gives them time with their families without making them fall be-

Research Programmer
Laboratory for Computer Science

The Advanced Network Architecture Group seeks a Research Programmer to develop and maintain operating systems to support research in network protocols, implement new network protocols, and implement signal processing algorithms to code audio and video for packet network transmission.

Requirements: A Master's degree in Computer Science. Knowledge of video coding standards, algorithms and architecture; specifically GDDT standard H.261; extensive knowledge of network protocols, specifically TCP/IP; fluency in C, and familiarity with the kernel of BSD UNIX also required. Should have demonstrated ability to understand, maintain, and modify large software systems, and ability to work independently. Past involvement in computer science research activity required.

Interested candidates should submit two copies of a resume and cover letter referencing Job No. RSC-106 to James H. McCarthy, MIT Personnel Office, Room 32-128, 77 Mass. Avenue, Cambridge, MA 02139-5267.

MIT is an Equal Opportunity/Affirmative Action Employer. M/F/H/V.

More computers are demanding more talent*

Fewer campus freshmen are choosing computer careers**

source is America's campuses. But with college freshmen interest in computer careers dropping more than two-thirds since 1982, you'll need to find other sources. Call us. We'll tell you about them.

Only 20% of computer professionals actively seek jobs through sources like local classifieds. Free reports!

Which, according to figures from our annual Job Satisfaction Survey, leaves 80% of the market largely unreachable through local papers. Yet easily reached through professional newspapers. Our research can show you how.

Over 247,000 professionals with CICS operating system experience are reachable with a single advertisement.

And so are hundreds of thousands of others with skills from DB2 to IBM S/38 to Unix. How? Call us and we'll show you.

Computerworld reaches professionals with key skills - a few examples from our survey-

Skill/Product	Product type	Experts in Computerworld's Audience
IBM PC compatible	hardware	523,573
IBM (all but PC)	hardware	488,965
Digital Equip. Corp.	hardware	214,375
MVS	operating system	257,248
Cobol	language/utility	443,166

Free reports!

Our skill survey reveals demographics.

Computerworld just completed a major survey of computer skills among its readers. The results can help you target your recruiting. Call John Corrigan at Computerworld for your free report.

We conduct the most comprehensive salary survey in the field.

Co-sponsored by the Data Processing Management Association, the annual report is available to you at no charge.

If you want to check out our numbers, just call us at this one: 800/343-6474 (in MA, call 508/879-0700). Ask for John Corrigan, V. P. Classified Advertising. Or write to him at Computerworld, 375 Cochinate Road, Framingham, MA 01701.

"...Computerworld's Campus Edition gives us the most direct contact with our target audience of computer and engineering graduates."

- John Wilhite -
Manager, Corporate College Relations
Hughes Aircraft Company

Hughes Aircraft, the aerospace electronics giant, is a full products company involved in the research, development, manufacturing, and support of over 100 different technologies. With about 55,000 employees in Southern California, Arizona, and Colorado, Hughes provides 12,000 separate products, services, and functions to the defense, space-related, and commercial industries worldwide. Since John Wilhite's job as Manager, Corporate College Relations is to oversee the recruitment of the country's top technology graduates, he advertises in *Computerworld's Campus Recruitment Edition*.

"Every year, Hughes recruits somewhere between 250 and 300 new graduates. The mainstream of our hiring centers around students with engineering backgrounds. Generally about 75% of our student recruits are in the electrical, mechanical, and computer engineering fields. Another 20% or so have scientific backgrounds, primarily in computer science and physics. The balance of our recruiting, then, is for MBA graduates with strong orientation in MIS or CIS. With one advertisement in *Computerworld's Campus Edition*, we get unique reach to all three of our student audiences.

"During the past few years, computer engineering and computer science graduates have become an increasingly important part of our recruitment efforts. So we need a publication that not only targets the exact audience we're trying to reach but also delivers quality responses. Based on the recruitment success of our first advertisement, we know *Computerworld's Campus Edition* gives us the most direct contact with our target audience of computer and engineering graduates. It definitely generates quality re-

sponses from students with the right types of backgrounds.

"In addition to delivering advertising results, the issue's Annual Student Survey serves as an important research tool. Upon receiving data on how students typically view Hughes Aircraft, we felt we needed to strengthen our image in this area. For continued success in recruiting top technical talent, we find feedback like this invaluable.

"To be effective, it's essential that our recruitment advertisement appears in a quality publication that students will read. We know *Computerworld's Campus Edition*, with its meaningful content, will have a long shelf life. Clearly, it's a publication that students will take back to their rooms pass along to fellow students, and keep for future reference. That means our advertisement in *Computerworld's Campus Edition* keeps right on working long after the issue date.

"Again this October, we'll be relying on the cost-efficient reach of *Computerworld's Campus Edition* to take our recruitment message to engineering, computer, and business graduates at leading colleges and universities nationwide."

Computerworld's Campus Recruitment Edition. On October 31, 1992, this exclusive edition reaches 150,000 top students enrolled in America's top computer and engineering degree programs. It's an advertising vehicle that works for John Wilhite at Hughes Aircraft. And it's your best way to recruit America's best computer career students. For all the facts, call John Corrigan, Vice President/Advertising Director, at 800/343-6474 (in MA, 508/879-0700).

MARKETPLACE

PC project managers pack punch

BY DANIEL J. LYONS
SPECIAL ADVERTISING SECTION

The huge success of Microsoft Corp.'s Windows has sparked new interest in personal computer-based project management packages.

In the past, these PC programs were too cumbersome and complicated for many mainstream users. But thanks to snazzy Windows interfaces, a wider audience is emerging.

In 1991, the market for low-end project management programs, priced under \$1,500 grew 40%, according to Mary Clif Lefebvre, a senior analyst at International Data Corp., a Framingham, Mass.-based market research firm. Sales of high-end products, she says, shrank 15%.

The reason: Many traditional high-end features are now show-

ing up on the easier to use, less expensive PC products. For example, most PC project managers are priced between \$600 and \$900 and can now handle several thousand activities per project making them as powerful as products costing several thousand dollars.

Computer Associates International, Inc. in Ithaca, N.Y., reported CA-Super-Project 2.0 to Windows late last year. The \$865 package costs more than rival Microsoft's Project for Windows (8695) and Time Line (\$699) from Symantec Corp. in Cupertino, Calif.

But, according to analysts, the CA package is more powerful, offering multilevel security, a variable use-over-time function and tight links to midrange and main-

frame-based platforms.

Vendors are also focusing on making products easier to use. Microsoft's Project for Windows 3.0, for example, offers a feature called Planning Wizards, which guide a user interactively through a variety of scenarios. CA-SuperProject 2.0 has a Beginner Mode for simple jobs and an Advanced Planning Mode for more complicated work.

Other advanced features now found in PC packages include flexible reporting, high-quality graphic output, cost-tracking and sophisticated resource management capabilities.

However, despite the trend toward ease of use, consultants say project management packages are still far from simple.

"Everyone's buying schedul-

ing tools even though they have no idea of how to do things," says Gopal Kapur, president

of The Center for Project Management, a consulting and software development firm in San Ramon, Calif. "Then they blame the scheduling tool for not doing the job for them."

Kapur and others agree that it's wise to get users classroom training or help from experienced trainers or consultants.

Critics also warn that even though low-end programs theoretically can handle heavy loads, they can be unbearably slow.

Shopping list

Consultants offer the following tips for buyers of project management software:

• **Match software to the job.** In construction projects, for instance, simple resource management facilities will suffice. In contrast, a software development project needs to factor in the skills of individuals, so resource management is a must.

• **Don't forget existing environments.** A company that uses, say, Microsoft's Word and Excel, might do best to choose Project for Windows, which has tight ties to those products. But if a company needs to move data between multiple platforms such as minicomputers and PCs, CA-SuperProject, which runs on DOS, Windows and Digital Equipment Corp. VAXs, may be a better choice.

What to look for:

- Maximum activities per project.
- Learning curve.
- Network/multuser support.
- Integration with other applications.
- Chart types available.
- Environments supported.
- Scheduling increments.
- Resource management facilities.
- Cost tracking.
- Reporting and communication features.

• **Don't buy too much power.** Consultants warn that using a product like Open Plan 4.0 from Wecom Technology, Inc. in Houston for the average business application is like using a cannon to shoot pigeons. Depending on the platform, this package can cost as much as \$180,000.

"If I were a general contractor and had lots of subcontractors and lots of accounting for time, then I could see using a higher end package," says Bob Carlson, senior staff member at MCI Telecommunications in Sacramento, Calif. "But for little ad hoc projects, you don't need them."

Carlson recently acquired Protrac Professional 2.0 (\$89.95) from Applied Microsystems, Inc. in Atlanta. "Sure there are things that it can't do," he says, "but I don't know what they are, and I don't care."

Lyons is an Ann Arbor, Mich.-based free-lance writer.

Four can be better than one

With more people doing project management, some firms find it makes sense to use several packages. Sverdrup Corp., an architectural, engineering and construction firm in St. Louis, uses four packages. The reason, says Bill Woloch, a project manager in the firm's Falls Church, Va., office, is simple: Different projects require different tools.

For instance, Sverdrup uses Micro-Frame Program Manager, an \$11,000 program from Micro-Frame Technologies, Inc. in Ontario, Calif., as the company's corporate reporting system.

For big projects, such as construction of baseball stadiums, Sverdrup uses Primavera Project Planner, a \$4,000 package from Primavera Systems, Inc. in Bala Cynwyd, Pa.

For smaller jobs, Sverdrup turns to Symantec's Time Line, which Woloch says is much easier to use and management uses Symantec's On Target (\$399). "Primavera is very powerful, but it's a complicated program, and there's a steep learning curve. So you try to use it only when you have to. It's like the Thompson submachine gun of project management. If you can do the job with a .22, why use the Thompson?"

Bids/Proposals/Real Estate

**RESOLUTION TRUST CORPORATION
SEALED BID AUCTION**

Sealed bids will be accepted by the Resolution Trust Corporation, Receiver for Condit Savings Bank, P.A., 67 Middle St., Lowell, MA 01853 for the following:

HITACHI DATA SYSTEMS EX 25

- Bid closing date: 7/24/92, 12 noon ET
- Availability date: 8/04/92
- 10% deposit (certified check) due with bid
- Currently in-service and maintained by HDS
- Configuration: 8 channels, 32 Meg

For a copy of the bid package, including terms of sale and equipment specifications, contact Paul Kerslake, Information Systems, at (508) 459-5694.

STOCK TRADING INDEX

Industry Almanac

NEW COVERAGE

Electronic Data Systems Corp., Shearson Lehman Brothers Inc., initiated coverage of EDS, which trades as General Motors Corp. Class E stock (GME), with a rating of outperform. The company's non-General Motors business topped \$3.7 billion in 1991, and Shearson expects it to grow 20% to 25% this year. The outsourcing market in which EDS competes racked up sales of \$106 billion last year and could grow more than 15% annually during the next three years, according to David Readerman, a Shearson analyst. The earnings outlook for the company is strong, as EDS controls some of the largest outsourcing contracts signed to date, he said, predicting that EDS will sign new deals this year worth a total of approximately \$6 billion.

Lotus Development Corp. Prudential Securities, Inc. recently tagged Lotus (LOTS) as a buy but cautioned that the stock is risky right now. Lotus is currently the leading spreadsheet supplier, but it also is entering fast-growing e-commerce markets, said Gibbs Moody's Prudential analyst. However, the company's cross-platform strategy should help protect its spreadsheet flank, he said. Groupware, which contributed \$41 million to Lotus' 1991 total sales of \$829 million, could represent more than \$300 million in revenue for the company by 1994, according to Moody. Lotus will inevitably go up against Microsoft Corp. (MSFT) and Borland International, Inc. (BORL) in the groupware ring, but Lotus has two years of experience behind it and faces little competition right now, he added.

RECOMMENDATION CHANGES

DOWNGRADED FROM STRONG BUY TO BUY: **Dell Computer Corp.** (Alex. Brown & Sons, Inc.). Dell's (DELL) current market share-capture strategy and its return-on-sales goal of 5% to 6% cannot be achieved simultaneously. Profit projections for the 1993 and 1994 fiscal years were cut, but sales expectations have increased. Recent products announced by **Compaq Computer Corp.** (CPQ) should motivate Dell to focus more on market share goals instead of its operating model. Dell will likely try to rev up revenue momentum with Gemini, a low-end product line priced 10% to 20% below Compaq's latest offerings. Gemini boxes are expected qtd soon.

COMPUTER INDUSTRY

IN BRIEF

Toshiba, IBM align

■ IBM and Toshiba Corp. last week confirmed that they will take on Intel Corp. by jointly developing solid-state storage devices using flash memory chips. Under the agreement, the companies will collaborate on design but will independently assemble and market their own devices.

■ Oracle Corp. last week continued restructuring its upper management. Geoffrey Squire, who has been president of Oracle's worldwide distribution sales organization since 1990, was named chief executive officer of Oracle International Operations. Oracle also hired Anthony Craig, a former CEO of Prime Computer, Inc., as senior vice president of its International Division, where he reports to Squire. Robert Shaw, a former Booz Allen & Hamilton managing partner, was named senior vice president of Oracle's Consulting Group. He will report to recently named Oracle USA President Ray Lane.

■ Richard Smith, a senior information systems executive at American Express Travel Related Services Co., a technology center in Phoenix, was fired a few days after the IBM sales executive who called on his account was terminated. Neither firm would comment on whether the firings were related. An Amex spokesman, however, said Smith's departure followed an investigation into his outside business dealings.

■ Next, Inc. last week said it has obtained additional financing in the form of a \$55 million credit line from investor Canon, Inc. and a \$10 million credit line from Chairman Steve Jobs. Funds borrowed on these loans will be converted to equity if and when Next goes public.

Hopes high despite second-quarter woes

Door second-quarter earnings statements have not shattered Wall Street's hopes for a late 1992 recovery, but they clearly have some industry pundits worried. Several companies last week either warned of worse-than-expected quarterly results or reported outright bad news.

Following Lotus Development Corp.'s disclosure that its second quarter would not meet earlier expectations [CW, June 29], software developers such as Easel Corp. and Software Publishing Corp., networking vendor Network General Corp. and chip maker Advanced Micro Devices, Inc., warned investors of their own fiscal second-quarter woes.

"It's not great, but not hopeless. And it sure beats last quarter," said Randy Brandt, a vice president at Duff & Phelps Investment Research Co. in Chicago, of the latest round of financial results.

Large systems vendors are expected to fare better, compared with the monumental losses recorded late last year. New orders for Enterprise System/9000 mainframes — still the bread and butter of IBM's balance sheet — are expected to boost that company's bottom line despite the industry buzz about user downsizing, according to Curt Rohman, an analyst at First Boston Corp. "Companies that run high-end mainframes are not scraping them," Rohman said.

Meanwhile, IBM's Application System/400 minicomputer line will coast with about 5% sales growth this year and no more until a new product cycle starts. This is expected in mid-to-late 1993, he added.

Reorganization efforts have thus far had little impact on either IBM or Digital Equipment Corp., but results are likely to appear later this year.

Analysts generally agreed that things will improve throughout the industry in 1992's latter half. The fourth quarter is likely to shine as users run through the inventory that remains in their annual IS budgets, they predicted.

Financial results for the quarter just ended, however, will

continue to fall short of the lofty expectations set early in 1992, particularly in the personal computer arena.

The culprit? Price wars, ac-

Not so at Microsoft. Users have snapped up Windows 3.1, Excel 4.0 and Word for Windows at a low clip, leaving Microsoft likely to surpass earnings esti-

up 15% from last year. Profits jumped to \$61.5 million from a 1991 loss of \$12.4 million.

The fourth quarter was strong and probably more of what we expect of our business in 1993," said Michael Musson, Oracle's director of investor relations. "We're seeing good growth in our Unix and desktop businesses," he added.

However, IBM mainframe license sales coasted at \$22 million in the fourth quarter of 1992, even with 1991's last quarter. Quarterly sales of Oracle's relational database — once the mainstay of Oracle sales — fell to \$43 million from \$49 million in 1991.

Easel, meanwhile, said it would report a loss. It blamed an inadequate sales staff and a blurred product message.

"We have been repositioning the company as a provider of client/server development tools, and it has taken us longer to reach the market with this message than anticipated," said Doug Kahn, president and chief executive officer.

Senior West Coast editor Jean S. Bosman contributed to this report.

Rocky road

Sales at some companies are expected to increase from last year at this time but decrease significantly compared with last quarter — with a few exceptions:

	1992 calendar annual-quarter sales	1991 calendar annual-quarter sales	Year-to-year increase	1992 calendar quarter sales	Quarter-to-quarter change
AMD	\$246.3M	\$276.8M	17%	\$487.4M	(15%)
Intel	\$4.7B to \$7.4B	\$4.4B	5% to 14%	\$8.2B	(18% to 28%)
Internally	\$23.9M	\$15.7M	53%	\$21.6M	11%
Network General	\$15M	\$13M	15%	\$19M	(20%)
Oracle	\$36M	\$38.7M	25%	\$29M	2%
Software Publishing	\$34M to \$36M	\$31.9M	7% to 13%	\$45.4M	(17% to 22%)
Projected					
			1992 quarter July 9	1992 quarter July 8	

cording to John Gorton, vice president of research at Van Kasper & Co., a brokerage firm in San Francisco.

PC makers can cut prices for only so long before bottom lines are seriously hurt, Gorton said. That is what hit Dell Computer Corp. this quarter, and that's what Compaq Computer Corp. is, in part, rebounding from, he explained.

Compaq's first-quarter sales of \$45 million, reported in April, were a 60% free-fall from those of a year ago, and the current quarter looks similar. The company said restructuring costs and aggressive price-cutting will dig into profits for this quarter and next quarter.

Steven Edelman, an analyst at Alex. Brown & Sons, Inc. in New York, reduced earnings estimates for Dell, citing heavy pressure from Compaq's latest low-priced offerings.

What the market needs to spur sales, Gorton said, is "something more exciting than cheaper and faster models. Price wars kill innovation."

Squeezed margins are not a PC hardware-only phenomenon. Software Publishing expects to report a loss or break-even results for its fiscal third quarter, which ended last week. The applications maker said a slowing in the DOS market and ebbing competition among Microsoft Corp. Windows-based products eroded profit margins in recent months.

mates again this quarter, Brandon said.

These products — out on time and in good shape — helped the company bag its quarter even before it started, he said. "You don't stop a runaway freight train."

Another high note was Oracle Corp., which closed out fiscal 1992 with sales of \$1.2 billion.

Banyan plans stock offering of \$10 to \$12 per share

BY JOANNE M. WEXLER
CAMBRIDGE

WESTBORO, Mass. — After years of false starts, networking software vendor Banyan Systems, Inc. last week said it has filed a registration with the Securities and Exchange Commission for an initial public offering (IPO) of 2.7 million shares of its common stock with an estimated per-share price of \$10 to \$12.

Banyan customers have been asking the company to go public or be acquired in order to gain the resources it needs to enrich its Vines network operating system and grow market share. Industry observers historically have pointed to both timing issues surrounding Banyan management upheavals and market conditions as the barriers that have prevented the IPO from go-

ing forward before now.

However, with A. Peter Hamilton named Banyan's president just one month ago, and the software IPO investment climate less than optimum, it is not clear that Banyan has found an especially opportune time for the move now.

David Wu, an investment analyst at S. G. Warburg & Co. in New York, said he suspects the main reason for Banyan's move is a "crummy environment" in competitive Novell, Inc.'s forthcoming NetWare 4.0 release, which is slated to include global naming services — Banyan's current claim to fame.

"Going public now would help because more cash on the balance sheet gives customers a better feeling that you're going to be around" in the face of new competition, Wu said.

The next thing in portables

Beta Shoe Co.'s Software Engineering Division today announced Compu-toe, a 6-ounce insert for steel-toed work boots. "It will blow your socks off!" a Beta Shoe spokesman said.

The Compu-toe packs the thrust of a 486 desktop and comes with an advanced OOPS interface that is invoked by simply walking around and kicking objects. Filing cabinets and garbage cans can be accessed intuitively with a single swift kick.

The vendor claims that Compu-toe was designed for difficult situations that do not respond readily to conventional desktop computing. Employee motivation programs, hot-rich office newsletters, three-dimensional spreadsheets and federally funded recycling programs are cited as examples.

Basic commands are executed by simple foot movements, leaving the user's hands free for virtually any purpose. Parallel processing is readily achieved with a pair of Compu-toes and a reasonable level of sobriety. Advanced users are said to benefit from tango lessons.

Compu-toe offers 4M bytes of on-sole RAM. Data compression hardware is standard. An optional step-bar-code reader can read crushed beer cans. There are also plans for the introduction of a track-shoe-ball later this year.

INSIDE LINES

Making music

► Strange bedfellows will be hosting a bash this week at the Win32 Professional Developers Conference in San Francisco. Archivists Microsoft and Borland will pool their efforts to produce a mutually competitive of theirs, database vendor Oracle. For Borland and Microsoft, which compete viciously in several software arenas, the friendliness symbolizes a shared need to promote Borland's C++ compiler and Microsoft's Windows NT operating system (see story page 14). Borland Chairman Philippe Kahn's omnipresent Turbo Jaz band is billed as the entertainment, says Kahn, who will be in Japan, according to one Borland source. Borland is seeking replacement players from Microsoft.

Sign of the times

► Client/server is gaining mind share at the Transaction Processing Council (TPC), a benchmarking group that is widely used by midrange and workstation hardware and software vendors. Beginning July 15, the TPC will require vendors publishing TPC results to designate whether they run tests in a client/server or a host configuration. This is good news for vendors of proprietary host systems, which have complained that the lack of such a designation has benefited the client/server camp. In a related undertaking, the

TPC said it expects to offer client/server-specific benchmarks within the year.

Marketing 101

► A source close to IBM said Big Blue can make its Intel-optimized SLC clone for about \$5 more than an 80386SX costs to produce. Our source wonders why IBM charges \$530 more for a Model 57SLC than for a similarly configured 575X, when lower SLC pricing might give users a reason to buy the machines and boost IBM's market share. An IBM spokesman declined to comment on specific chip pricing other than to say that IBM makes the SLC at a cost-competitive price. He added that the SLC offers more performance than the SX and thus should cost more.

Different strokes

► DEC last week quietly cut prices on many of its PCs by as much as 25%, but sources said that was a long-planned action. Reports are that DEC will top prices still further next week as a rebuttal to the current tag-slashing frenzy touched off by Compaq's blitz. Along the same lines, AST will not be cutting prices, chiefly because the company expects to have totally revamped its line by the end of next month.

Dirty electronic tricks

► An interloper posing as a Perot spokesman recently posted an address box on CompuServe, we hear. One correspondent tipped off the campaign after the impostor's answers made him sound a little suspicious.

Campaign spokesmen denied a connection, and the on-line address disappeared shortly thereafter.

At your service

► Apple Chairman John Sculley noted recently that Kaleds could be used for both Apple and IBM to make a foray into the information services industry. He called the creation of a national information network key to their future. "IBM and Apple do not feel constrained to just be in [information] products. Both companies at this time are looking at getting into information services," Sculley said Apple and IBM could move into information services separately as well.

Only a year after Apple shelled out \$26.5 million to settle a suit brought by The Beatles over the name "Apple," the company may be facing another trademark fight. This year's offender: Newton. Those in the industry may remember it as the maker of an upcoming handheld personal computer device from Apple, but the rest of the world knows it as a fig cookie made by the Nabisco Foods Group. Nabisco spokesman Mark Guttsch said the company has held a trademark on "Newton" for 101 years, adding, "We are very protective of our trademark... and we have been known to be very aggressive in protecting our rights." Phone, fax or CompuServe News Editor Alan Alper with news tips at (800) 343-6474, (508) 875-8931 or 76537.2413, respectively. Or try CompuServe's 24-hour voice-mail tip line at (508) 820-8555.

DROWNING IN PAPER?

Managing the tremendous output of paper is one of today's most critical and costly concerns. Over 2,500 MVS data centers use \$AVRS/TRMS individually or combined to address this issue. \$AVRS/TRMS, from Software Engineering of America, provides a total solution to this expensive and resource-consuming problem. \$AVRS/TRMS handles all aspects of report management/distribution, and output management, including production reports, end-user reports, JCL listings and error messages, SYSLOG, and compiles. \$AVRS/TRMS is powerful, yet easy to use and is accessible to all levels of personnel through a variety

of full-screen, menu-driven interfaces including CICS, ISPF, VTAM and TSO. Full cut-and-paste, windowing and PC interfaces make \$AVRS/TRMS a flexible and broad-based solution. \$AVRS/TRMS interfaces with all popular security systems and also has multiple levels of internal security.

\$AVRS/TRMS provides a complete and cost-effective solution to all aspects of report management/distribution and output management. \$AVRS/TRMS can control the paper deluge for your installation just as it has for data centers of all sizes and configurations worldwide.

For a no-obligation 45-day free trial or for further information, call Software Engineering of America at 1-800-272-7322.
